**Scrap:** This forest of upended P-40 Warhawks, stripped of valuable items, are just a few of the nearly 4,000 surplus aircraft of all types neatly aligned at Walnut Ridge, Ark., awaiting the acetylene torch that will cut them apart and the 10-ton tractor that will mash the metal into scrap. The field was established as a storage depot by the Reconstruction Finance Corp., which is scrapping \$8,000,000 worth of combat aircraft per day.

THE AVIATION NEWS

## Washington Observer

**SURPLUS COMMANDOS**—With 76 C-46 Commandos now in surplus, CAA, Surplus Property Administration, and Curtiss-Wright, the plane's builder, are all anxious to complete type testing—SPA in particular, as there is at present a demand for these aircraft. However, certification tests have been going on at the C-W plant in Buffalo, which will be closed about the first of the year. It's likely none will be complete by then, and SPA wonders if the demand for C-46's will permit until such time as the new C-W plant in Columbus, Ohio, is completed.

**NO DELAY**—Meanwhile, Beechcraft Airways reportedly has bought two Commando for \$20,000 each, either in swap CAA type approval, or for use on its Mexican affiliate, where an ATC is unnecessary. Curtiss-Wright is discussing with Reconstruction Finance Corp. to lease six C-46's, convert them for commercial cargo operations and then lease them to non-scheduled carriers.

**INTELLIGENCE**—The Combined Intelligence Observatory Survey recently was charged by Joint Intelligence Objectives Agency when the British withdrew from the project of gathering technical data about enemy production for dissemination to American industry. Reason for British withdrawal was that they set up their own agency, Ministry of Supply, and even, with the American group. The alphabetical confusion continued, however. Directly under CIOB was Technical Industrial Intelligence Committee which under the change is known as Technical Intelligence Branch or TIB instead of TIC. Re-

lease of the most valuable reports has been held up by security, although more observers in Washington find it difficult to understand how it could give aid to an enemy. Rapid release during reconversion might, on the other hand, help American industry.

**AIRPORT DISPOSAL**—In being made disposal agency for surplus airports, RFFC has been given a job it did not want and one over which it will not be afraid boss. If the Surplus Airport Disposal Committee set up by Surplus Property Administration carries in full power, RFFC's airport disposal policy will be controlled by the Army, Navy and CAA which are represented on the committee, but none of which want the disposal job although wanting a water in the policy.

**AUTOGYRO TO SMITHSONIAN**—CAA soon will present to the Smithsonian Institution, for its historic aircraft section, the only known available autogyro in existence. It is a two-seater produced by Paramount Aviation in 1934 and sold in 1935 to CAA's predecessor, the Bureau of Air Commerce.

**COMMUNITY COMPANY**—There are indications on Capitol Hill that the community airline company versus regional corporation issue is due for another airing. Senator Brewster, of Maine, has suggested that the question "has not been settled right," and could not be considered a closed issue. Brewster and some other Senators feel that the issue is very much alive and will be reopened.

The XB-42 bomber which last week was set for a transcontinental speed run.

# HANSEN COUPLINGS

*first choice*

The battle cry of precision industry is greater production, lower costs, and it can be brought about by savings in time, material and effort. And that is why Hansen couplings are today's "first choice." Hansen couplings have all their environmental popularity on their performance, a performance that spells economy on every job.

For instance the Hansen Air couplings save time, effort and money because all the operator has to do is push plug into socket if it is connected, locked and air is automatically turned on, all in a matter of a few seconds. There is no hunting or fumbling to connect or disconnect, no binding or pinching, either by hand or tool, and the work freely, because they are fully protected. To disconnect operators merely slides sleeve back with thumb plug as inserted, it is disconnected and air is automatically shut off. Operator never leaves his seat to connect or disconnect coupling or even to turn on or off the air. He wastes no time, effort or air. Full interaction prevents locking of hoses. There's a Hansen coupling made for air, oil, grease, oxygen, acetone and gasoline, each of which will save time, effort and material on every job. Send in for free industrial catalog.

## News at Deadline

### Ranspeck to ATA

Rep Robert Ranspeck, Georgia Democrat, probably will become executive vice president of the Air Transport Association. There are reports that he has accepted the post, which would be a new position. If so, announcement may be made after today's meeting of ATA directors. Ranspeck himself has been noncommittal.

Since the death last March of Col. Edgar H. Gorrell, ATA president, the organization has been headed by Stuart G. Tipton as acting president. Tipton is ATA counsel and former assistant general counsel for the Civil Aeronautics Board.

Ranspeck, at 88, is one of the well-known men in Congress. He is Democratic whip in the House, where he has served 16 years.

### Eastern Orders 202's

Eastern Airlines Inst. Weismann signed order for 50 Martin 202's representing an investment of more than \$15,000,000. First of new fleet is to be delivered in April, 1947, with the order to be completed by November, 1947. Capt. Eddie Rockenbach, president of EAI, signed the order in New York in the presence of Glenn L. Martin. Martin revealed his firm will be able to handle overhaul of all 202's after 400 have been sold.

### Aero Board Complete

The Aeronautical Board, top government organization for aircraft design and production for Army and Navy, is expected to reveal its plans and policies this week. Importance of the board is indicated by its membership, appointments to which have been completed and include Lt. Gen. Ira C. Eaker, deputy commander, AAF; Maj. Gen. E. M. Powers, assistant chief of air staff, material and services; Col. J. B. Cary, War Department general staff operations representative; Vice Admiral Marc A. Mitscher, deputy commander of Naval Operations; Adm. Rear Admiral L. B. Richardson, assistant chief, Bureau of Aeronautics, and Capt. L. A. Modjeski, chief of aviation plans for Admiral Mitscher.

## Industry Observer

Steadily increasing criticism was evident among airline and aircraft executives at the National Aviation Clear over lack of positive and aggressive action by our State Department in its negotiations with foreign countries, mainly Great Britain, for landing rights.

TWA expects to use its first two Lockheed Constellations for United States service which will start shortly before the first of the year. Its Douglas C-54's will open service to Cairo about the same time if the British will permit.

Engineers, designers and research men conferred with torsional vibration problems will find "Evaluation of Effects of Torsional Vibration," a valuable fundamental treatise on the subject. The 578-page volume presents the experimental and analytical methods used by research departments of a number of leading diesel engine manufacturers. Reports were prepared by SAE in response to a request from the Navy for advisory cooperation of the society. A special committee was formed to undertake the project.

TWA will be using Trans-World Douglas on all planes both domestic and foreign. Several of its DC-3's already are carrying the new designation.

Harry Playboy's new six-scheduled contract cargo air service in start operations about east of St. Petersburg has already completed negotiations with several firms.

Increase in the weight of North America's new experimental Navy fighter by more than half a ton has made drastic redesigning necessary. This will result in some delay in the project and first flight tests may not come before March.

Consolidated Vultee at San Diego has completed its PB4Y Predictor contract with the Navy with the delivery of 15 planes. Just prior to VJ Day the Predictor program was one of the Navy's most important ones.

Kym is scheduled to complete and deliver its PR Fireball to the Navy by December 1. The Ryan San Diego plant is an excellently equipped facility. Navy has made no final decision about future Ryan contracts, but the company is reported to have a promising new jet fighter model that indicates performance much above the Fireball.

Pyotr has cancelled its contract with Canadian for the fast medium bomber XY-5 which became part of the Interim long-range and off-target contracts in the closing months of the war. Approximately 20 of these planes have been accepted. At one time the contract had been cancelled only to be resuscitated to meet a request from the British for this type of plane.

They soon report that the automobile industry does not feel that production of personal aircraft is of sufficient volume at present to make it worth their while to go into the business at present. Some estimates put it at about a year and a half before they can decide whether production of private airplanes will be attractive to the automobile industry.

Experiments in highspeed takeoff and landing at maximum visibility, with the plane doing only a few feet before landing in the runway, are being conducted by Piper Aircraft Corp. at the Lockheed, Pa., airport. Objecitve is to obtain faster airport utilization for takeoff and landing practice, regardless of weather.

Part of the space in the General Motors Aerospace plant at Dayton, Ohio, is being diverted to manufacture of walking machines by Aeropace for GM Frigidaire Division.

The 20-place Lodestar mentioned in Aviation News last week, now in mockup stage at Beech Aircraft Corp. will have four engines. It is designed to fly fully loaded with one engine dead to clear a 50 foot obstacle in 2,000 feet. In fact 500 ft engines are submerged in the wings. It is expected to cruise at about 190 mph.

November 26, 1945

## Hydromatics ON THE CONSTELLATION

Increased speed, range, payload, dependability and efficiency of operation are combined in the new Lockheed Constellation. Hamilton Standard Hydromatic propellers help provide these new standards of performance.

## Increased Research, World Air Police Force Urged at Clinic

Oklahoma City conference also brings realistic, yet optimistic, discussion of future of air transport and personal aviation; Eaker, Miescher warn against losing airpower leadership.

By ALEXANDER MCSEURLY

Impressive account by conferees of aviation research on a scale far beyond pre-war days, and a demand for unification of military services in a manner which will permit aviation to take its proper role as the major policing force against aggression, were the two main points of emphasis at the 1945 National Aviation Clinic at Oklahoma City last week.

Scheduled speakers and floor discussion at the three-day session also viewed the future prospects of commercial air transport and personal aviation with a realism, but optimism, which reflected the frank dreams of an immediate Juiles Verne air age, but admitting the immaturity of air transportation for an enormous segment of the world's population through airlines, non-scheduled air services and private planes.

Keynote—Keynote of the three-day session was sounded by Eugene E. Wilson, vice-chairman of United Aircraft Corp., when he told some 250 clinic registrants "Aviation is a young art facing breath-taking technological possibilities whose limits are fixed only by the intelligence, courage and zeal with which we pursue them."

Four revolutionary developments, all of which find their greatest usefulness in the air, were clearing for full speed ahead in research, Wilson said. They are electronics, jet and rocket propulsion, supersonic aerodynamics and nuclear physics.

Inter-service—Wilson described aviation as a trinity, comprised of the air force, the aircraft industry, and air commerce, foreign, domestic, public and private. To the

U.S. air force the world must look for police power to deny the opportunity for an aggressor's conquest; to air commerce the world must look for freedom of communication and transport which will renew war incentives. And the aircraft industry, through technological development, and production must supply both.

Added emphasis on the importance of airpower as a world policing agent was given by Lt. Gen. Ira C. Eaker, Deputy Commanding General, AAF, when he told the Clinic "In an atomic age airpower probably most important power means of striking an enemy with atomic bombs but the only available protection against the misuse of atomic explosives."

**Joint Warning** — Adm. Vito-Admiral Marc A. Mitscher, Deputy Chief of Naval Operations, another Clinic speaker, sounded a grim warning:

"Twice, we as a nation have

### Air World Division

Trend of future military airpower is so definitely in the direction of the rocket and the guided missile as to indicate that civil aviation will grow faster and faster and assume very great relations to air power, Lt. Welch Pogue, CAB Chairman, told the National Aviation Clinic last week.

The predicted future air power would be a "new type of armament" and civilian aviation would receive services as a transportation service in any future international conflict rather than as an integral part of military aviation. His stressed the importance of keeping military air power as a civil service and a factor in matters of peace and administration, and warned of the danger of civil aviation becoming the "stepchild" of the military services.

been unprepared for war and twice our allies have given us the element of time to apply our great productive power to our war machine. Present trends indicate that any future war will strike with speed greater than ours, and that we will not have that same element."

**Program** — A strong five-point program of government aviation

### FOUR-ENGINE JAP BOMBER:

This plane, found by U.S. Naval intelligence air intelligence officers when they landed in Japan, is a Jap Navy four-engine bomber. Called by the Japanese, it is estimated to have a 6,500-mile range with fuel load less and 6,500-mile range without bombs. Its maximum speed is about 350 miles an hour. So far as is known, the plane was not used by Japan or America.

# Newest Navy Jet Power Units Are Lightest Yet Constructed

Westinghouse *Yankee* measures only 19 inches in diameter and "baby jet" only 9½; both are first such motors of entirely U. S. design to be canted in flight.

The Navy has disclosed that the lightest jet aircraft engines yet constructed are being built for the Navy by Westinghouse, including the *Turbine* which is 19 inches in diameter, and the so-called "baby jet" which measures only 9½ inches across and was developed for use in private aircraft.

These engines, the Navy reports, are the first jet power-plants of wholly American design to be tested in flight. They have these different strengths and light weight is the axial-flow compressor which Westinghouse's aviation gas turbine division has incorporated for the first time into a U. S. designed and tested engine. In the axial-flow compressor, the basic basic elements—the air compressor, the combustion chamber, the turbine to supply power for the compressor and the jet nozzle—are arranged in a line, one behind the other.

**Advantage**—Navy engineers pointed out that the small diameter of the axial-flow engine makes it particularly suited to high

speeds at which it develops an extremely large amount of power. Because of its small frontal area and correspondingly low air resistance, it lends itself to a cleaner, more streamlined overall aircraft design.

Recent models of the *Turbine* jet have a weight of less than half a pound per pound of thrust, or less than half the weight of piston engines. The *Turbine*'s total diameter of 19 inches is about half that of an "up-and-down" engine of comparable horsepower.

**Power**—The greater part of the power produced in the engine from the combustion gases—3,400 hp—is extracted by the turbine to rotate the compressor at its rated 18,000 rpm. Left over as propulsive energy is the jet stream, to carry the aircraft forward, at 1,900 pounds of thrust, which is equivalent to around 1,400 hp at 375 mph.

The jet engine yields a propulsive thrust of 275 pounds, or 27½ horsepower at modern plane speeds.

**Others Secret**—Westinghouse be-

## Arctic Tests Set

Three months of Arctic cold-weather tests will begin soon for two Lockheed P-80 jet fighters and a Lockheed transport plane, en route to the Ladd Field, Alaska, "Wright Field" at Fairbanks.

Sub-zero temperatures will afford a thorough testing of the winter performance of the two aircraft. Crews will be under close observation of Wright Field's Arctic test program.

**Governor**—Preservation of the P-80 under extreme winter conditions will be tested, and the Ladd Field flight propane extended substantiation on the performances of a new jet fighter.

The Arctic tests will be conducted at the Macmillan Desert at Wright Field's Marine Flight Test Base.

Winter tests of the P-80 will be directed by Capt. Howard T. Markey, while Capt. J. C. Ralby directs Constellation tests. Ten Lockheed engineers have been assigned to the project.

gan its work on turbo-jet engines at the Navy's request the day after Pearl Harbor, in 1941, with no information on the progress of similar development by the enemy or our Allies being afforded the company until their planes were at the test stand.

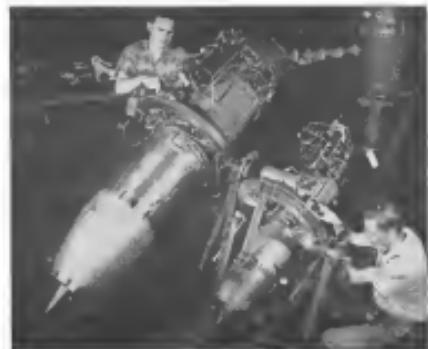

Later engines, still under military security, have been produced which better the weight and power characteristics of the two newly-anounced power units.

## Pittsburgh Appointment

The new head of the Allegheny County, Pa., Public Works Department, John B. Sweeney, will direct a \$15,000,000 Pittsburgh County airport program. His assistant is J. Twin Brooks, general manager of the county airport.

Sweeney's appointment as a \$16,000-a-year executive devoting full time to aviation was another step in Pittsburgh's campaign to become one of the nation's air service centers. He will be in charge of both County airport and the new Greater Pittsburgh airport.

**Program**—Billed for early 1946 is a huge \$12,000,000 development program of the new field calculated to make it Pittsburgh's air passenger terminal. The older county field then will serve as a private and freight flying terminal.

New Navy Jets—Technicians adjust the Navy's two new Westinghouse jet engines, the *Turbine* which is 19 inches in diameter, and the "baby jet" which is only 9½ inches in diameter.

# Nazis Developing 16-Ton 'copter, Adjustable Wing At War's End

Huge rotary-wing craft was designed to lift trucks and tanks across rivers; variable-incidence wing control found on experimental Blohm & Voss transport.

## By BLAINE STURLESFIELD

A 16-ton helicopter to lift five tons, and a Blohm & Voss airplane with variable-incidence wing control were in development by the Germans in France at the war's end. They are described in reports by a British intelligence mission, just released by the U. S. Commerce Department's Office of The Publication Agency.

The *Yak-12*—Arbeitsjäger 201 helicopter was intended to lift loads, trucks and the like across rivers and to haul such loads as bridge girders into place. Paper design work at Breguet Design Office at Toulouse was destroyed when the plant was bombed, but detail was given from memory by 800 members.

It has twin rotors, 55 ft. in diameter, counter-rotating and mounted at the tips of a transverse beam consisting of a center portion and jacked outriggers built up of tubular struts.

**Details**—Blades are tubular steel spars, 4 mm. outside diameter, wall thickness 0.5 mm., cylindrical and constant ratio from root to the 4.5 m. station, whence they are swaged down to a parallel-sided oval at the tip, 8 cm. major axis, outside depth 3 cm. max., gauge 2.5 mm. Over the section of cylindrical spar, blades are rectangular, 77 cm. chord tapering to 26 cm. Roots are wood, with 2-ply covering. Airfoil section is NACA 230 series 12 percent thickness-chord ratio. Blade area = 8.4 sq. m., solidity 0.6.

Original power was two W冈 401 engines of 1,600 hp each, later increased to 2,000 hp. Engines, mounted toward center of the beam, are hooked up with gears and shafting, with clutches arranged so that either can drive one or both rotors. The beam is the main structural member and the fuselage, left uncovered except for a 3-man cockpit, provides no load space, but has a hook and cable with release slip. There is a carriage wheel under each engine, and a tail wheel.

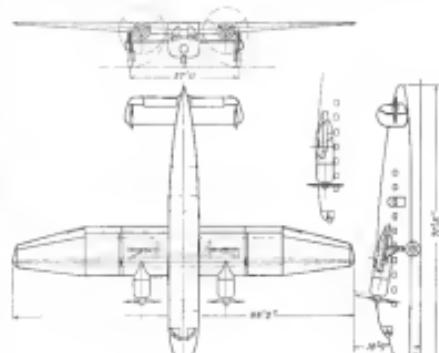

**Early Model**—Staff members said the machine was designed at 12 metric tons gross, to lift 2

## New Republic Plane

The second airplane in Republic Aviation Corp.'s personnel plane line will be an elliptical twin-engine five-place landplane which will cruise at about 175 mph and set for approach at 1,000 ft. All-metal Marchetti Repulse powerplant, disclosed last week.

The Marchetti and the airplane was now in the design stage but would be in production in time for the 1947 introduction. The plane will be powered by two Pratt & Whitney 325-hp air-cooled engines, the same powerplant that is going into the *Beech* airplane, four-place plane which is now going into production. Part of the revised *Beech* with the larger wings and tail fin, another accommodation was to be exhibited in New York this week.

actuating jacks. The entire wing, which is built around a large tubular spar, including engine and wheels, can be rotated through 9 degrees on the transverse axis, between plus 3 and 12 with reference to the fuselage. The wings turn on two adjustable hinges fixed to the fuselage. Change of

**Variable-Incidence Wing:** Two prototypes of the Blohm & Voss transport equipped with a variable-incidence wing were inspected by a British mission in France after the German defeat. Designed to cut take-off run and give other savings, neither of the two planes had been flown.

**Heavyweight Helicopter:** Sketch shows 16-ton helicopter being developed by the Germans when the war ended. It was designed to lift tanks and trucks across rivers and to lower such loads as bridge girders into place.

mission is effected by two screw jacks actuated by electric motors and reduction gear, through which an instrument panel.

Estimated takeoff run is 385 yards with 30-degree flap and 3-degree incidence, as compared with 221 yards with same flap and 12-degree incidence. Speed of takeoff is 89 mph. or 119 mph., respectively. Design is said to combine low drag in cruising, with short landing gear, keeping fuselage floor horizontal and low for convenient loading.

► **All-Steel:**—The plane is an all-metal, high-wing type, with reinforced trapezoidal landing gear, carrying 18 passengers and crew of three, with 1,100 pounds of cargo, over 300 miles range.

A rear compartment is adaptable for five more passengers plus luggage. Fuel and oil, 420 and 40 gallons respectively, are stored in twelve spars in the center section of the craft's wings.

## Canadian Airports

Canada is turning its surplus airports over to the Crown Assets Allocation Committee in the Department of Transport. Fields not needed by the department as places for civil airport development are set aside for disposal by the Canadian War Assets Corp.

The Department of Transport takes into consideration fields needed by civil flying clubs and by the Royal Canadian Air Force auxiliary squadrons. No fields have yet been sold by the War Assets Corp.

## SPA Step Stresses Airport Problem

The extreme ticklishness of the problem of disposing of surplus war-built airports is illustrated by the Surplus Property Administration's Regulation 16 which establishes an advisory committee to counsel the Surplus Property Administrator on disposition of the fields, even though the Reconstruction Finance Corp. has been designated as the disposal agency [AVIATION NEWS, Oct. 22].

Reg. 16, released last week, constitutes the Surplus Airport Disposal Committee to consist of representatives of the War and Navy Departments, CAA, SPA and RFC. Its duties are to advise on the manner in which, and the conditions on which, the disposed agency should be authorized to dispose of particular airport properties.

► **Conditions:**—As foreseen by AVIATION NEWS, the regulation sets forth the principle that financial return to the Government is a secondary consideration exceeded by "the best interests of the public and the nation and the Armed Forces." Airports may be disposed of to state and local governments for "considerations other than cash."

However, airports disposed of in such manner must be open to the public, with exclusive leases barred. This is implementation of CAA's determination that publicly-owned airports at their facilities shall not be leased exclusively to any one operator.

► **Background:**—Although RFC was designated as the airport disposal agency about two weeks ago in a general SPA order, RFC has been

unable to assume the responsibility. The same is true of the Army, Navy and CAA, although all three have an interest in the future utilization of the fields.

This is believed to be the motivation behind the establishment of the unique advisory committee

## Palmer Named Aide To Fairchild Head

Richard C. Palmer, who has been in Washington for the past 14 years and who was general manager of the National Aircraft War Production Council until its dissolution, has been appointed special assistant to J. Carlton Ward, Jr., president of Fairchild Engine & Airplane Corp. Palmer will assist Ward in both Washington and New York.

Fairchild is manufacturing the C-12 Packet for the Army and is working on a commercial version

**Richard C. Palmer**

of the plane. And extensive post-war training programs are being developed in an improved version of the P-34 fighter-bomber plane in production. The company will continue to develop the Ranger engine working on a prepatent unit.

In addition, the company has interests in the Bausch & Lomb, Stratos Corp., Fairchild Instrument & Camera Co., and Alin Corp., a subsidiary.

► Palmer is vice-president of the National Aerospace Association in charge of its air defense council. Through the management of NAWPC he was in close touch with the entire aircraft industry during the war and with the armed services.

## Junking of Old Planes Pressed Before 'Economy' Clamor Rises

RFC and SPA scrapping \$8,000,000 worth of combat aircraft daily, allaying industry's fears that a vast pool of obsolete models would threaten full-scale development of new types.

By WILLIAM KROGER

The aircraft industry's fears that a vast pool of World War II planes kept for years would threaten the full-scale development of new types is being eased with the scrapping of \$8,000,000 worth of combat planes per day by the Surplus Property Administration and the Reconstruction Finance Corp.

Within days it is expected that the scrap-airplane market will now swing to the high gear with disposal of about \$8,000,000,000 worth of surplus combat aircraft—probably the entire stock.

► **Quick Action:**—Responsible government officials are determined to wipe out what now is considered to be largely an obsolete air force before any Congressional or public clamor arises for its retention for reasons of economy alone. Illustrating this are 87 B-22 bombers—nearly the entire production—awaiting the scrap heap at Walnut Ridge, Ark. AAF has retained a few B-22s for continued testing and experimentation, but the others are being scrapped as surplus aircraft that will be broken up and the metal melted down.

The planes were flown direct to the Arkansas storage field from the factory at Fort Worth.

A somewhat similar instance was the salvaging of 59 incomplete B-29s at plants in Wichita, Kan., Marietta, Ga., and Omaha, Neb. ► **Six Centers:**—The RFC storage field at Walnut Ridge is one of six to which surplus warplanes are being flown to be scrapped. Others are at Altus and Clinton, Okla., Kingman, Ariz., Augusta, Ga., and Ontario, Calif. Eventually more than 1,000 aircraft will be received onto these fields. Operations at each will be similar to those at Walnut Ridge, shown to magazine and newspaper representatives recently, where nearly 4,000 planes of every type are stored.

As a general plane is flown into a storage field, an Army crew strips it of "critical" and secret items—comprising, clock, radio and radar, bombsights, armament. The RFC salvage crew takes over, removes engine, tries it out, and other items suitable for resale. The remains of the plane are torn apart and melted fast by a huge furnace.

► **Value in Doubt:**—The next stage has yet to be decided. RFC has sold a small amount of scrap metal. The value of this scrap is questionable. More important metal in it is aluminum—there are 18,000 lbs. in a B-24 bomber. If this were melted down, it is estimated that approximately 85 to 70 percent of the plane's metal could be recovered.

► **Jacksonville:**—The Jacksonville furnace, expected to be in operation about Jan. 1, will handle 15 tons of scrap per day. It is believed the refined metal will be 94 percent pure aluminum, which, it is hoped, can be sold at nine cents per pound. The Navy is now

**Job Done:** Pictures such as this were common during the war to illustrate America's air might. This is almost the opposite. The war over, hundreds of Army bombers, including 87 B-29s that never even saw combat, await scrapping at the Reconstruction Finance Corp.'s storage depot at Walnut Ridge, Ark. Engines and removable items are salvaged, the airplane torn into scrap metal.

tearing apart an average of five fighter planes per day at Jacksonville.

Most time-consuming and evidently the most costly part of the scrapping operation — separating the various kinds of metal—is being done at Jacksonville by prisoners at war. When the prisoners are repatriated early next year, scrapping costs will soar. Then will come the question of whether the remaining operation can be conducted profitably.

► **New Alloy**—Also complicating the question is the fact that in reality the metal coming from the Navy's furnace will be a new alloy. It cannot be used in aircraft and industrial purposes as proposed could not absorb the 1,000,000,000 pounds. RFC figures eventually will be available without destroying the markets of the existing producers of light metals.

RFC is cooperating with the Navy in the Jacksonville project and the furtherance when complete will serve as a pilot plant on which the RFC will base its decision as to whether to install facilities at the six storage depots.

► **Other Problems**—The salvaging of metals in surplus aircraft is only one of the many problems confronting RFC in the scrapping of combat planes. Possibly a larger headache are the engines which are being removed before the airframe is stripped down. Navy officers at Jacksonville state that only one percent of the engines are useless. The remainder, both there and at the RFC storage depots, are being "picked"—preserved for possible later sale.

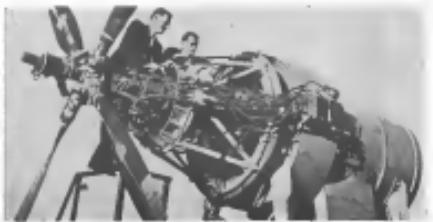

All Jacksonville alone there are 1,544 engines picked, ranging from 1940, Jacobs and Ranger up to the Pratt & Whitney R-2800 and the Wright 3350. Some of them could be used commercially, but these will be far more in supply than the commercial market could absorb, and that still would leave the question of what would happen to the original producer.

► **May Be Scrapped**—Considered option is that, before the 18 months preservation period is up, these engines will go the way of the shiny new B-32's. On Nov. 15, RFC closed the bidding on some 1,930 engines of various makes and sizes. The sale was conducted as a test of the market and what prices might be expected. Results had not been tabulated last week, but officials were not optimistic that the sale would provide the answer of what to do with the engines.

#### GENERAL ELECTRIC'S NEW PROPELLETTED AIRCRAFT

New photo of General Electric's "propjet" engine, first type of our bureau to drive both a propeller and generate jet propulsion simultaneously. Engineers believe this type of engine will be used extensively to power transports. Above, a drawing which shows how the propjet engine fits in the wing of plane.

#### Republic Contracts To Buy Franklin

Agrees to purchase Aercooled Motors Corp. for \$1,500,000; substantial part of output will go into Seabees.

Republic Aviation Corp. has entered into agreement to purchase outright the Aercooled Motors Corp. of Springfield, Ohio, for approximately \$1,500,000, giving Republic all rights for manufacture of the Franklin aircraft engines, scheduled to be used in rotary aircraft.

► **Progress**—Mr. Marchev said "Hepburn's acquisition of an important and progressive aircraft engine company is one more step in our definite plan to provide personal planes at a moderate price for the mass and his family who will fly in the future."

The Republic Seabees, a four-place amphibious personal plane being built by the parent company, will be powered by a Franklin 332-hp. engine. In line with substantial orders already placed for the Seabee, an important percentage of Aercooled Motor production must be brought up to date," Marchev said.

"If personal plane prices are to be brought within reason for all who want to fly comfortably and safely, the whole concept of airplane manufacture must be changed from 'handbuilt' design for the few to production design for the many."

#### PRIVATE FLYING

## Flaws in U. S. Personal Aviation Sharply Outlined by Clinic Speakers

Showcomings in airport operation, flight instruction, plane design and federal regulation stressed in outlining course private flying must follow to reach mass acceptance.

Skeletons in the closet of today's personal aviation rallied vigorously last week at the National Aviation Clinic at Oklahoma City. As speakers and floor discussion presented a well-rounded realistic criticism of the shortcomings in airport operation, number of airports, flight training, personal plane design, and governmental regulation which must be corrected before mass public acceptance of the personal plane can be achieved.

Most thought-pushing to the many aviators gathered at the clinic was the discussion by James H. Harrington, Mansfield, Ohio, flight school operator, as necessary for correcting plane designs for easier ground handling, better visibility and ease of control.

► **Criticism**—Harrington blamed much of the difficulty in flight training on poor ground-handling characteristics of today's plane. "It takes as much time to teach a student to taxi a plane as to fly one," he declared. He urged redesign of planes to make them handle as easily on the ground as an automobile, and called for redistribution of weight to prevent tendency of the ground. He also urged further simplification of controls.

► **Regulations**—Wolfgang Langewische, pilot, author and consultant to the Personal Aircraft Council, expressing hope that the recent trend toward simplification of civil air regulations would continue, declared the existing regulations "are still the greatest single hindrance to the growth of private flying, next to the law of gravity itself."

"The bulk of air regulations is set up so that you must at every turn, prove positively your compliance with the regulation. It is as if you had to go to the district attorney every three months to prove you hadn't stolen anything." ► **Complaints**—He attacked

private pilot license test, now somewhat changed in the new regulations, he believes that all our small airplanes would long ago have become practically unmarketable in design. The test requirement was the only thing which interfered.

► **Appeal**—An appeal to CAA Administrator T. P. Wright, CAB chairman L. Welch, Pease, CAA Safety Director Fred Lager and Airport Section Chief Charles Derschow to spend "a couple of weeks not in the grass root" with private flyers, airport operators and private plane dealers, was made by Arthur I. Horner, Des Moines. Government officials would get a much clearer picture of the needs of private aviation and would make their rights on the future of private flying as the result of such a trip, he forecast.

He predicted they would come to these conclusions.

► **The Big Market**—The big market for personal planes will be among farmers, salesmen, executives, lawyers, business men and doctors between 30 and 65 years old.

► **100,000**—It is the market for personal aircraft in towns below 10,000 population, especially in the Midwest. There are 100,000 of such towns.

► **The Perme Requirement**—For development of personal aviation the establishment of at least one

PRIVATE AND SCHEDULED FLYING OPERATIONS

This comparison of private and scheduled flying prepared by CAA, shows a sharp increase in mileage flown by private planes pre-war, up to a maximum of 245,367,000 miles, as compared with a total of 141,215,561 miles flown by airlines the same year. The chart does not show war years, but is an indication of how private flying expansion may be expected to continue.

### POST-WAR AND PRE-WAR SKYRAVERS:

Redesigns of the sparsely pre-war Skyraider into a more, more stream-lined all-metal version has been announced by Tennessee Aircraft Inc., Nashville, Tenn., division of General Aircraft Corp. Sketch of the elevated post-war Skyraider is shown above in contrast to the flight picture of the fabric-tail cantilever plane below, which was one of two CAA-approved pre-war sparsely types.

surfside adjacent to every incorporated town of which there are 16,000 in the U. S., plus about 4,000 other landing fields in emergency areas.

Berman urged formation of a committee representing a wide spread of national organizations and interests to convince Congress of the need for legislation to insure airports such as service program. ► **Facilities Bill**—Stating criticism by John Paul Jones, Des Moines private pilot and attorney, regarding the lack of minimum facilities at the average private airport, ardent cheers from the private flyers gallery as he listed an impressive list of particularities about thirty airports, poor sanitary facilities, lack of service and poorly kept up rental planes Jones quoted his wife, who has been his frequent companion on plane trips, as his authority on the unsatisfactory conditions.

We must have facilities at the airports where my wife or I can powder her nose without having to hold it at the same time, he warned airport operators.

► **Question**—Asked by William Ong, Kansas City, in the discuss-

ation, he urged the purchase of an airplane as the most practical solution for the average person wishing to learn to fly, and development of flying clubs at the second best solution.

► Production that enlightened and less restrictive federal regulations, greatly improved production facilities, the now apparent market and a curb of misleading advertising would combine to bring many design planes within reach of the man in the street was made by W. M. Rooney, Culver Aircraft chief engineer, at the end of an historical summary of aircraft design problems since World War I days.

He spoke against arbitrary limitations though common performance requirements except for standards pertaining directly to safety, such as stall control, structural inspection validity and reliable power plants.

### Lightplane Firm Formed in Tacoma

Organization of a lightplane producing firm in the Pacific Northwest by two former Boeing employees has been announced in Tacoma, Wash. Two experimental models now are underway and final tests are expected to be completed in eight to 12 months.

Known as Pacific Plane, Inc., the firm is headed by John A. Edman, president and Donald J. Wheeler, chief engineer. It really got under way last year when a pilot designating himself as "Wheeler" wrote a contest sponsored by a national magazine. This design, with modifications and improvements, will be one of the three models which the firm intends to produce.

► **Design**—Known as the Wheeler Model III, it is a twin-boom, single-engine pusher with a capacity of four passengers. Other data: crating speed, 118 mph.; top speed, 130 mph.; landing speed, 45 mph.; wingspan, 37 ft. 6 in.; 65 hp. engine; tricycle landing gear.

Other projected models are a two-passenger coupe and a six-passenger executive model. The latter will be powered by two 125 hp. engines, have retractable landing gear and a top speed of 190 mph.

The firm's plant in Tacoma will be housed in a factory for which plans are now being completed. A crew of six already is engaged in preliminary engineering work.

### Texas Field Offers Low Flight Rates

Dallas operators charge \$50 for an hour of dual instruction, \$40 for ten hours of solo.

A special low flight rate to beginners of \$40 for ten hours of solo or \$55 for ten hours of dual instruction, is bringing large numbers of new flight students to Love Field Airport, five miles from Dallas, Texas, city limits.

Besides operating an air college, complete with barracks for students, Lou and Gene Poole, owners and operators of the field also have an airport restaurant and provide overnight accommodations for visiting flyers and a bus which will take the flyers into Dallas at any time of day or night.

► **Experienced**—Their present field is their third operation in the Dallas area. They were at Love Field, Dallas, until the city moved them to make room for additional buildings. Then they had a field at Grand Prairie, midway between Dallas and Fort Worth, until the Navy bought it for training purposes.

The present field has five all-weather runways averaging about 3,500 ft. in 40 by 128-ft. hangars, a restaurant and kitchen, a barracks, and an antiseptic well with a 35,000-gallon underground tank for fire protection.

One of the hangars is used for repair and storage of their own planes, eight Piper J-3s, a Bellanca Sportster and Beechcraft Skipper, while two other hangars are used for rental storage, and the fourth is leased by an independent group of aviation mechanics.

► **Staff**—The air college has a full-time ground school instructor and four flight instructors, two of them women. Approximately a dozen students are living in the barracks at the airport, to put in full time on flight courses for private and commercial licenses.

The low special rates is beginning as far back as paid off, Lou Poole reports, in an increased volume of flying time on his equipment, and in creating new customers for plane sales.

► The moderate cost idea is also extended to restaurants, with a weekday meal at 55 cents, and a Sunday meal of 75 cents. As a result, the restaurant not only serves the flyers but attracts a considerable trade from residents and business people in the airport area.

A main purpose of the new

**Foto Airport**: Aerial view of the Love Field Airport, near Dallas, shows the four hangars, restaurant, administration building and barracks, and the all-weather runways. The Poole Flying Service and Aviation College is conducting an interesting test of attracting maxu visitors to aviation by low-cost flight instruction for beginners.

### Stinson Cuts Down Noise In Voyager

One of the best illustrations of a new trend toward reduction of noise, both internal and external, in private airplanes, for the greater comfort of the flyers and the surrounding public, is the sound-level reduction job which Stinson division of Consolidated-Vultee Aircraft Corp., Wayne, Mich., has done with its new four-place Voyager 130.

First mentioned in *AVIATION NEWS* Oct. 15, the soundproofing on the Voyager includes both an interior blanketing of the cabin with diagonal fiber-glass insulation material, completely covering the ceiling except for the windows, and dual engine mufflers. The mufflers are surrounded by heater jackets. These take heat to warm the cabin from the left bank of cylinders, and heat for the carburetor to prevent carburetor icing from the right bank of cylinders.

► **Engine**—The engine muffler job was demonstrated to an *AVIATION NEWS* representative during a recent visit at the Wayne plant. The Voyager 130 flew over at low altitude and altitude as the engine is equipped with a 130 hp. engine, and produced much lower in intensity than the racket level produced by a 150-hp conventional four-place plane. The advantages in eliminating "surface noise" complaints from persons living near airports are obvious.

► The moderate cost idea is also extended to restaurants, with a weekday meal at 55 cents, and a Sunday meal of 75 cents. As a result, the restaurant not only serves the flyers but attracts a considerable trade from residents and business people in the airport area.

A main purpose of the new

is to make possible the installation of a dome loudspeaker in the cabin, for the radio receiver, taking the place of the uncomfortable headphones, heretofore a requirement for most private planes with radio equipment.

The new noise speaker, installed over the pilot's head, will bring the pilot both aural and conventional broadcasts on the small General Electric receiver. Far "discards" who still insist on headphones, the set is equipped with a jack on the panel, to plug in the phone connection.

The radio equipment also includes a transceiver which is tunable from 3000 to 3800 kilocycles, while the receiver is equipped with both conventional and loop antennas.

### Lee Kouri, Former WASP, Takes Bendix Sales Post

Appointment of Lee Kouri, formerly a member of the Bendix personal aviation radio sales staff, has been announced by the Bendix Aviation Corp., El Segundo, Calif. Miss Kouri, 25, was employed at Glenn L. Martin Co. in job evaluation and sales work before joining the first WASP training contingent.

Miss Kouri formerly attended the University of Maryland and the University of Southern Calif. She was employed at Glenn L. Martin Co. in job evaluation and sales work before joining the first WASP training contingent.

## Pilot Errors Blamed For Four Accidents

Pilot errors, through recklessness or faulty judgment, were blamed for four out of five aircraft accidents investigated by the Civil Aeronautics Board. Wing failure due to an aerobatic maneuver caused the other.

Results of the accidents and CAB findings follow:

**SPRINGFIELD, ORE.** Private Pilot, Ray E. Foyt, 35, Pittsboro, N.C., was killed, and his wife, Mrs. Walter J. Foyt, 35, Pittsboro, was seriously injured when their Cessna 170, serial number 1948, crashed at Portland Airway Field, April 11, 1946, when the two already had more than 1,000 hours flying time. Both were en route from the coast to a service station in Oregon. Foyt landed toward the east in a field near Portland, and the two took a road leading toward the town. The field became flooded when the cold weather caused the snow-melted snow to run into the concrete driveway. As the plane taxied across the field, it struck a snowdrift, and the plane went into a spin. Foyt was killed, and his wife was severely injured.

**CALIFORNIA.** Possible cause of accident was pilot's failure to take off in time.

**PORTLAND, ORE.** Commercial Pilot, David Dale Mattson, 35, Springfield, Ore., was killed, and his wife, Mrs. Dorothy L. Mattson, 32, was seriously injured when their Cessna 170, serial number 1948, crashed at Portland Airway Field, April 11, 1946, when the two already had more than 1,000 hours flying time. The plane was flying westward over the Columbia River, and the two were en route from the coast to a service station in Oregon. On the way, they stopped at a gas station in Portland. When Mattson taxied the plane to the runway, he found the engine would not start. After a few attempts, he taxied the plane to a nearby field, where he found the engine would not start again. He taxied the plane back to the runway, and started the engine again. The plane taxied to the end of the runway, and then turned around. It taxied back to the middle of the runway. It is thought that the pilot was attempting a nosewheel landing, but the plane was flying with a tailwheel landing gear. Both engines stalled, and the plane crashed.

**CALIFORNIA.** Possible cause of accident was pilot's failure to see and avoid birds.

**SACRAMENTO, CALIF.** Student Pilot, John G. Goss, 21, Los Angeles, Calif., from Bakersfield, and Robert W. Smith, 21, Fresno, Calif., were killed when their Cessna 170, serial number 1948, crashed in a field near Marysville, Calif., April 11, 1946. Both were en route from Bakersfield, Calif., to Fresno, Calif., and were flying over the desert area, normally about 10,000 feet above sea level, when the aircraft went into a spin. Goss was a student pilot, and Smith was a friend of Goss. The plane was then pulled out of the spin, but the two were unable to get the plane under control. There is no known cause during which the two students would have been flying in such bad weather conditions, but it is felt that the cause may have been a lack of skill in getting the plane out of the spin, and not bad weather conditions.

**NEW YORK CITY.** Private Pilot, Charles H. Goss, 21, of New York City, was killed, and his wife, Mrs. Goss, 21, was seriously injured when their Cessna 170, serial number 1948, crashed in a field near Bronx Park, Bronx, N.Y., April 11, 1946. Both were en route from the Bronx to New York City, and were flying over the Bronx area, normally about 10,000 feet above sea level, when the plane went into a spin. The two students were flying in bad weather conditions, and the cause of the accident is not known.

**MOORE PARK, CALIF.** Commercial Pilot, James E. Johnson, 35, of Los Angeles, Calif., was killed, and his wife, Mrs. James E. Johnson, 32, was seriously injured when their Cessna 170, serial number 1948, crashed in a field near Moore Park, Calif., April 11, 1946. Both were en route from the San Joaquin Valley to Los Angeles, and were flying over the San Joaquin Valley, normally about 10,000 feet above sea level, when the plane went into a spin. The cause of the accident is not known.

**CALIFORNIA.** Possible cause of this accident was failure of the engine to develop sufficient power to maintain altitude in the air, and the pilot was unable to make a safe landing.

## Briefing For Private Flying

Advantages of the transport-type business airplanes to the major industry executive as a personal means of transportation were demonstrated last week in a small group of aviation writers who were guests of Jack Fife, TWA president, in a flight from Washington to Oklahoma City to the National Aviation Clinic, in the Lockheed Lodestar Transport which the company has arranged for his use in first-hand research on new equipment and for his personal transportation. While not every business executive would have the service and maintenance facilities of a major airline at his disposal, it is probable that there are several hundred executives in this country if not thousands, who could make an extensive air transport with a cruising speed at least equivalent to air line block-to-block speed, pay for itself in time saving. It is known that a number of companies in widely scattered industries are buying some of the medium-sized transports placed in surplus for the use of these executives and their personal aircraft service operators, particularly on the West Coast, and the flying banner is refliting these planes for the needs of businessmen. However the number of planes now being used in this manner is only a small fraction of the potential market.

**FLYING WEATHER.**—Southwestern flying weather was beautifully evident during the Oklahoma City clinic and more than 100 planes flew into surrounding airports for the meeting. Typical of the businessman and flyer who is becoming a stabilizing influence in private flying and demonstrating its practicality was Henry King, motion picture producer and director, who pilots his own plane for business trips all over the country.

**SOLO VACATIONS.**—Bill Strohmeier, New York veteran private pilot and writer, suggests a solo vacation as a flying resort as a good way for the average individual to learn to fly. If a man can take a week off and spend it at a resort airport where he can take a couple of lessons a day in the morning and late afternoon he won't get rusty between lessons and he can solo easily in a week's time without crowding his lessons too much. Strohmeier, in his paper at the Clinic, pointed out that the average busy person is extremely lucky if he can find two periods in a week to get in an hour of flying time. Weeks drag by before he even notices and more months before he gets enough solo time for a license, but the shortest part of the grand is the period before solo.

**TRAINING DEVICES.**—As another suggestion for speeding up training Strohmeier called for development of a simulated flight trainer to give a student some really beneficial profitless training, simulating landing conditions which now requires hours of trial-and-error flight practice for many students. Such a device would overcome much of the initial sole problem he believes, and in view of some of the training devices developed for military aviation training, he believes it is quite possible to develop it.

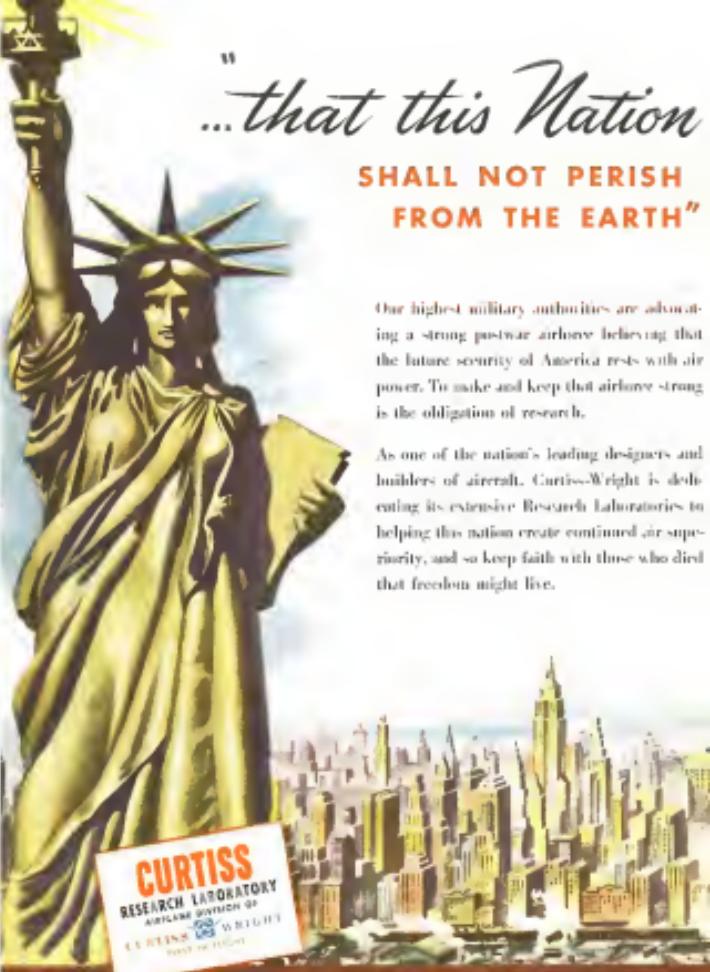

—Alexander McSally

**LOS ANGELES, CALIF.** Commercial Pilot Charles H. Goss, 21, of Sacramento, Calif., Goss, his wife,

Mrs. Goss, 21, Davison, Calif., Goss, his wife, and his parents, John E. Goss, 51, and Mrs. Goss, 49, of Los Angeles, Calif., were all killed when their Cessna 170, serial number 1948, crashed in a field near Bronx Park, Bronx, N.Y., April 11, 1946. Mrs. Goss, a civilian engineer for an oil company, had observed the accident from her office window. She said the plane had been flying low over the Bronx area, and had just passed over the Bronx River. At the end of the light house road, the plane went into a spin, and then hit the ground. The plane exploded on impact, and the two parents were buried in a hole which contained the remains of the plane.

**NEW ORLEANS.** Private Pilot, Charles H. Goss, 21, of New York City, was killed, and his wife, Mrs. Goss, 21, was seriously injured when their Cessna 170, serial number 1948, crashed in a field near Bronx Park, Bronx, N.Y., April 11, 1946. Both were en route from the Bronx to New York City, and were flying over the Bronx area, normally about 10,000 feet above sea level, when the plane went into a spin. The cause of the accident is not known.

**CALIFORNIA.** Possible cause of this accident was failure of the engine to develop sufficient power to maintain altitude in the air, and the pilot was unable to make a safe landing.

"ETERNAL VIGILANCE IS THE PRICE OF LIBERTY"

**BREEZE-BUILT MOUNTS**  
*kept RADAR on the beam*

From before Pearl Harbor  
to Final Victory

Now, for the first time, it can be told . . . the story of how Breeze built mechanical precision microwave vision for the U.S. Signal Corps . . . to keep radar accurately beamed . . . to put guns on target . . . and to blast enemy aircraft out of the skies.

Preserved in the late 1930's, the Breeze Mobile Antenna Mount for anti-aircraft radar was in the war from before the start to the finish. It was a Breeze-Nazuated radar set that detected the Japanese sneak attack on Pearl Harbor on December 7, 1941. Rushed to England in the waning days of the war, Breeze-Nazuated radar first helped to keep

blitz out of London; later reduced bomb-head effectiveness by 75 per cent.

Before Victory was won, thousands of Breeze-built Mounts were produced and delivered—in time and on time to every theatre of war. This production record, backed by product performance, often further convincing evidence of the wide range of Breeze "know-how". Listed below are other Breeze products

which have made the Breeze Mark the mark of dependability the world over. The diversified skills and facilities which enabled Breeze to hold these precision items in large quantities for war are now available to other manufacturers for peacetime production. Perhaps Breeze can solve that complex production problem for you. For a complete analysis and recommendation, call to a Breeze Engineer.

## 1,000,000 Personal Planes In 1955 Seen By WPB Expert

Approximately 2,000,000 families will be able to afford them, study made for CAA indicates; expansion of auto market in early years is cited.

Operation of 1,000,000 personal planes in the United States by the end of the first post-war decade is entirely feasible, it is predicted by Victor Perlo, chief of the industry research branch, Bureau of Programs and Statistics, War Production Board.

Perlo bases his conclusion on a study which he has made for use of the Civil Aerodynamics Administration which indicates that approximately 1,800,000 families or one quarter of the number expected to be in the \$15,000-over-income bracket, will be able to afford airplanes easily within the first post-war decade.

**Comparison.**—The WPB analyst drives a comparison between the personal plane and the automobile in its early years.

He points out that in 1912 there were 20,000 registered passenger autos in the United States, approximately the same as the number of registered airplanes in this country in 1941. By 1912 the number of registered autos had expanded to more than 900,000. He believes that similar growth in airplane use will be equally rapid.

His survey is based on the premise that the government will give full support to aviation through airports and other facilities, that the aviation industry will continue its enterprise and that continuous full employment will be maintained.

**Price Decline.**—Price of the desirable private airplane will be reduced by large-scale production to approximately \$2,500 by 1955, the analyst expects. He expects most airplane users to own automobiles also for which he estimates a price of \$1500. With full employment he expects the average income of a gainfully employed person in 1955 to be \$3,500.

Perlo calculates a total operating cost for both auto and family-sized airplane of \$1,300 a year including \$900 for depreciation of the plane. Of this amount \$600 is figured for the cost of operating the auto, a reduced cost figure, the \$300, most frequently used as a year's cost

for automobile operation. The reduction is made because additional use of the personal airplane is expected to cause less use of the automobile.

**Best Type.**—The analyst believes the four-place family-type plane will prove the best seller, but many families who do not afford that vehicle will purchase smaller two-seat planes, and that these solo make up several hundred thousand of the total number in use.

Since the United States will be the only country with the possible exception of Great Britain, producing private planes on a mass-produced, low-cost basis, it is anticipated that most future purchases of private planes will be made in this country. The extensive sales figures showed 8 per cent of all U.S. passenger cars marketed went overseas. The foreign market for personal planes is expected to be at least as large, per-

### AERONCA GOES TO MOVIES:

A theater-going Aerona Champ tandem lightplane, painted into Washington's last week to take a vintage part in the re-enactment of a balloon on the main business street. The plane is owned prior to a Victory bond contest conducted by the theater.

## Fly-Or-Yourself System Continues Plans

National Fly-Or-Yourself System, Inc., headed by Howard T. Ailor, has opened New York office in the Woolworth Bldg., 333 Broadway, as it continues preparations for opening the national airplane rental and charter service.

The organization, which will have affiliated air bases scattered throughout the country, owned and operated by local veterans and other aircraft service operators now established (AVIATION NEWS, July 3) plans to use two-place and five-place planes of standardized designs, developed especially for the service.

**Less Cost.**—Ailor, who before the war headed Ailor Fly-Or-Yourself System at Rosemont Field, N. Y., the largest charter and rental operator in the country, expects the standardized planes to make operation simpler and less costly for the customer. Charges will be based on the time flown between bases of the system, so that the customer can deliver the plane at any system base and need not return it to his starting point.

## Instrument Costs Cut By Kollsman

A new line of lower priced aeronautical navigation and engine control instruments announced for personal planes by Kollsman Instrument division of Square D Co.,

### Course for Teachers

Link Aviation Devices, Inc., is conducting a two-month refresher at its Binghamton, N. Y. plant for former high school teachers recently discharged from the armed forces who want to use their aviator experience as teaching tools. This course is the first of a series planned by the training device manufacturer, in similar groups.

Most of the enrollees were pilots or Link trainer instrutors in our air forces, and as such were acquainted with the various phases of aviation. The Link course seeks to refresh the teachers on aviation fundamentals for teaching high school students. Besides instruction on how to use the Link trainer as a demotivator, 100% test in subjects related to flying, the course includes an introduction to amateur radio, standard studies, Subjects considered include: Living in the Air Age; How an Airplane Flies; How an Airplane is Flown; Aircraft Structures, Weather, Power, Navigation, Air Traffic, and Communications.

is expected by the firm to make instrument flight available to many pilots formerly unable to afford it.

The new instruments, known as the Kollsman Best Line, will lessen almost one-half the investment in instruments, according to Victor E. Carbosaro, vice-president of

Square D. The line includes standard altimeters, sensitive altimeters, expanded barometers, large and small compasses, vertical speed or climb indicators, manifold pressure gages and tachometers.

**Reasonable Price.**—The reduction in price has been achieved partially by eliminating the performance requirements of military and airline service for extremely high and low temperatures to which the personal plane will not be subjected. The company continues to offer its standard line of instruments for military and airline planes.

Included in the Scout line of personal plane instruments all of which are radium treated and set to fluorescent (black) light, are:

► Standard altimeter (10-38,000-ft) single pointer, one revolution per 10,000-ft, stationary dial, settable pointer and barometric setting nobles. Price \$16. 75 inch mounting hole. Price \$34.

► Sensitive altimeter, same range, two pointers, one revolution of long pointer for each 1,000-ft, 36-ft graduation. Settable pointers, barometric setting nobles of 28-31 inches of mercury range. Price \$76.

► Air speed indicator, standard type, 0-600 and static connections, offered in three ranges, 30-166-mph, 30-200-mph, 30-250-mph. Price \$34. 75% inch mounting hole, weight, 3 pounds.

► Small compass, standard floating card type compass, with convenient 38S and EW compensating screws, accessible from front. Weight, 8 ounces. Price \$34. 75% inch mounting hole. Price \$33.

► Vertical speed (climb) indicator. Range 0-2,000 fpm per minute up or down. Has 3% scale hole, logarithmic scale with widely spaced graduations near level flight point and closer graduations near scale limits. Compensated for temperature effects on mechanism but not for altitude and temperature compensation or thermal insulation. Weight 17 oz. Price \$50. ► Manifold pressure gage. Range 10-50 inches of mercury, standard single pointer. Compensated for temperature changes. Price \$30.

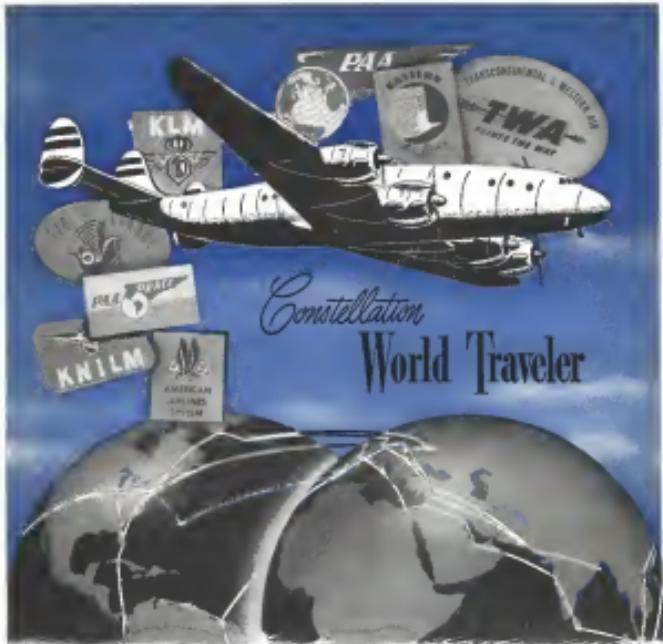

Also in process of development for the Scout line are fuel pressure gages, oil pressure gages, thermometers, and engine gages.

The new line is being produced at Kollsman, Elmhurst, N. Y.

**NEW NASAO OFFICERS:**

New officers of the National Association of State Aviation Officials, elected at the recent St. Louis convention are shown, left to right: Leo G. Desnoes, director, Oregon State Board of Aeronautics, vice-president; Edward F. Knapp, director, Vermont Aeronautics Commission, secretary and treasurer; Wallace L. Anderson, executive director, Pennsylvania Aeronautics Commission, president; and C. F. Corrall, Indiana aeronautics director, vice-president.

Cyclone 11 power, proved by ten million hours of operation for war, is now the first choice for flight on present international trade routes. Eight aircraft, operating in commercial competition between every major nation of all continents, have chosen it by the Wright Cyclone-powered Lockheed Constellation. The power

9.	Thermost-sensitive element at "Y" drain — oil meter		

Diagram shows the location of components in a typical application of G-E temperature control. Controllers (the only heavy component) can be located almost anywhere in the ship. All components except thermal elements are interchangeable. The system operates on 24 volt dc.

The thermocouple elements include A, used for oil or engine exhaust; B, for exhaust air; C, for engine head. The small size of these elements facilitates their insertion where

PILOTS FREE TO CONCENTRATE ON FLYING

PILOTS shouldn't have to be continually adjusting the position of cooling flaps and exit shutters. Yet, in the past, that was the only way they could minimize drag consistent with engine cooling requirements. The tendency was to play it safe, leaving flaps and shutters open wider than necessary. The resulting drag penalty as much as 10 percent loss of speed as a 400-knot ship.

It's a different story now, because of  
the new electronic transmission system.

Employing a remarkable new temperature-sensitive material, General Electric has developed a system that automatically positions flaps to maintain the most efficient temperature of engine, oil, compressor air, and coolant. Extensive drag is avoided. So is the danger of overheating. The pilot can devote all his attention to other duties.

Light & Light

This new G-E system involves but a slight weight penalty; only 4.6 pounds in the case of engine-head temperature control. It holds temperature accurately,

Say all the SONGS you can  
—and know all you have

The heart of the new system is this fast-developing conversion. A highly sensitive, polarized relay (the top of each) responds to the signals from the thermo-sensitive elements, energizing power relays (bottom). The power relays then activate the trap arms which are open at the two flaps. The rate of response is extremely rapid, and the following principle emphasizes human action associated with lightning.

The logo consists of a circular emblem with the letters "GE" inside, followed by the text "PRECISION PRODUCTS & ENGINEERED SYSTEMS FOR AIRCRAFT".

## PRODUCTION

### Canard Aircraft Principle Regarded As Valuable in Transport Design

Long obscure patent, similar to others later assigned to Lockheed, is viewed as one answer to problem of long driveshaft in such planes as DC-8.

Were it not for World War II, Lockheed Aircraft Corp. probably would have had in flight by today a four-engine canard transport.

Although the project has been shelved by Lockheed for the time being, qualified aircraft engineers believe the canard principle still holds possibilities of development in transport aircraft.

Bellou's recent experiments with small canard types, and Curtiss-Wright's canard fighter, the Attacker, undoubtedly have provided research groups with performance data that will influence further study of canard transport designs.

**Obscure Patent**—The heretofore-obscure 1939 patent (No. 2,139,303) of a Los Angeles aircraft engineer, William L. Lewis, was recently reexamined in the light of Douglas Aircraft Company's DC-8 passenger transport design using principles extending from the tail of the Bellou plane.

Airline engineers question the placing of the engine driveshafts in the nose section of the transport and running drive shafts the length of the fuselage to the propellers in the tail.

The Lewis canard patent offers a solution of what some view as a "drawback" by mounting the engines in the extreme tail area of the fuselage with a short-direct link to propellers.

**Advantage**—Lewis began his aviation career with the Lewis & Vought Corp., now Chance Vought Aircraft, after World War I, and has held engineering development positions with Douglas, Boeing, Northrop and other major aircraft manufacturers. He believes that flight characteristic problems of the canard may be more than offset by advantages of engine placement, cabin noise reduction, and the offering of a wing unencumbered by engine nacelles.

**Canard Design** Two patents issued to William L. Lewis, Los Angeles aircraft engineer, are for craft with powerplants in the rear. One has its rudder mounted forward on the fuselage, the other calls for rudder mounted rearward on the wings.

designs (*Cover, Aviation News*, Aug. 23, 1948) under development at the end of the war. The Johnson-Bessas patent was assigned to Lockheed Aircraft Corp.

In Nazi planes—Lockheed's file of canard patents was increased two years later, on Jan. 27, 1942, by the assignment of a patent issued to C. E. Johnson covering a control system for incorporation in canard type aircraft.

Because there is so close a resemblance to the configuration of the German Jagger P-38 all-moving jet fighter design, which was under wind tunnel test when the war ended, a United States patent (Design Patent No. 153,871) issued Sept. 1, 1942, to Richard E. Metz as is interesting today as it was apparently hopelessly radical at the time of issuance. Viewed from above, the Metz design has strict resemblance to a folded-paper toy "dart" glider. Yet the wing of the P-38 has a sweepback almost as pronounced as that in the Metz design.

#### Test Device Available

A fee of \$10 a day has been set by Civil Aeronautics Administration for testing airplane windshields for resistance to collision with birds in flight. CAA has at its Indianapolis experimental station a pneumatic gun which shoots carcasses of chickens at speeds up to 500 mph. The water, with CAA operators, now will be available to windshield manufacturers.

#### AIA Retains Wilmer, Keane As Readjustment Aides

Merton H. Wilmer and Michael J. Keane Jr. have been retained by the Aircraft Industries Association as consultants on readjustment problems.

Wilmer was deputy director, aircraft division of the War Production Board from Dec. 1944 until shortly after V-J Day. Previous to that he was an AAF major serving as executive officer of the Air Technical Service Command. Also an AAF major until recently, Keane served as assistant to Brig. Gen. F. M. Hopkins, Jr., ATSC, on termination problems. Prior to that he served with the 5th Air Force in the Pacific.

Keane and Wilmer are managing the Washington law office of Wohl, Gotchall and Marquay.

## AVAILABLE TO OPERATORS OF LARGE AND SMALL AIRCRAFT

A superior, solvent-processed lubricant, D-X Aviation Oil was manufactured to meet the specifications of Army and Navy grades 1065, 1080, 1100, 1120 and 1120 aircraft engine lubricating oil. Characteristics include maximum resistance to carbon, sludge and lacquer formations, and maximum power performance. Refined from selected paraffin base crudes, its enduring film strength provides complete lubrication. D-X Aviation Oil, with inherent chemical stability, increases hours between overhauls, helps prevent loss of power, keeps valves free-acting. Your inquiry invited.

**MID-CONTINENT PETROLEUM CORPORATION**  
TULSA, OKLAHOMA

# ADJUSTMENT IS AUTOMATIC

—on the great Goodyear  
Single Disc Brake

PILOTS everywhere are praising Goodyear's new Single Disc Brake with automatic Adjustment because of its many advantages. This recent development of Goodyear's 36 years' experience in aviation combines light weight with high efficiency and requires absolute minimum servicing by design and construction; this brake needs no hand adjustment, no "wearing in" period, nor any take-up during the life of the lining.

Particularly important for light-plane owners to whom plane-maintenance is a problem, the Goodyear Single Disc Brake with Automatic Adjustment represents freedom from an annoying chore. For commercial operators, the brake means lowered shop costs.

An ingenious compensating mechanism within the brake

keeps clearance constant and uniform as the lining wears down. Pilots like the steady "pedal feel"—braking pressure is always the same. Moreover, no design or usage dispenses cooling on the brake due to elaborate engineering of race, slots and brake lining. Powerful and rugged, the new Single Disc Brake has no free parts; it gives the lightweight brake-wheel-unit per foot-pound of energy capacity, and is simple to install and service.

This self-adjusting brake is fully approved in both hydraulic and mechanical types, and is winning high favor on small, medium and large aircraft. Whether you choose it or its more proved sibling, the Goodyear Multiple Disc Brake, depends on your plane and its operating condition. For complete information, write Goodyear, Aviation Products Division, Akron 16, Ohio or Los Angeles 54, California.

The development of this new solid-type automobile tire for aircraft is not especially an operation involving frequent landings or paved runways.

Manufacturers, Airline Operators, Distributors, Dealers,  
and Private Flyers depend on GOODYEAR for—

- TIRES • TIRES • TIRES • AIRCRAFT TIRES • HYDRAULIC HOSE • HYDRAULIC PREDRIED • GASKETS
- GRIPSEAL • LIFE RAFTS • RUBBER • COTTON-CORD SHEETS • FUEL AND OIL CRIS • RUBBERIZED FABRIC •

## Beech, Cessna Give New Wind Tunnel

Under the joint sponsorship of the Beech and Cessna aircraft companies, the municipally owned University of Wichita will set up a new wind tunnel and an aerodynamic research center.

The two companies have contributed a total of \$100,000 for the project. The wind tunnel will replace the one which has been in use at the university since the early 1930's.

**Need**—Beech and Cessna officials say that because some of the nation's major aircraft plants are located in Wichita they saw a need for adequate wind tunnel facilities at the local university for the purpose of training students "who might spend part of their time actually working in the aircraft plants in order to obtain practical and well-rounded background in aviation."

This is the second time in recent years the two companies have given financial assistance to im-

prove research facilities at the university. Previously, each contributed \$100,000 to the Wichita Industrial Research Foundation, which is located at the university and which makes its services available to all industrial enterprises in the area.

## Solar Co. Expands Diversification Work

Solar Aircraft Co. has announced an expanded program for the diversification of its post-war products with the receipt of an order for stainless steel parts for use in the manufacture of atomic bombs.

Edward T. Price, Solar's president, said the company has several contracts from the Culver City Ordnance plant operated by the Clinton Engineering Works near Krocus, Calif.

**New Field**—Solar at San Diego, which has been active in the diversification of its products, also announced a line of major parts

for racing automobile racing cars, a comparatively new field. Another item in Solar's post-war program is the company's new triple seat exhaust system which was exhibited at the Jurupa Chamber of Commerce sponsored Aerofest in San Diego. This unit is for use on small sport and commercial planes and combines in an exhaust manifold the functions of muffler and heater.

At the recent directors' meeting, the regular quarterly dividend of 18 cents a share on common stock was declared.

## Inspection Device Speeds Up Work

Inspection of parts in regard to size is expected to be speeded up by a new device developed by Pratt & Whitney and termed Electrotronic Computer. Comparative readings are given by small neon tube lights on the sides of the instrument. If a part is undersize the minus light on the left remains on. If the part is oversize, the right light only is on. A part with in limits doesn't light either tube.

### WHY PLANES BECOME OBSOLETE

	BASED	BOMBLOAD	RESPONSE	RANGE
	8 ft	100 lbs	10 sec	100 miles
	12 ft	1000 lbs	10 sec	100 miles
	14 ft	1000 lbs	10 sec	100 miles

## New-Type Brake

Development of a compact, hydraulically designed aircraft brake with a "built-in" cooling system has been reported by the Firestone Tire and Rubber Co.

John W. Thomas, company chairman, said the brake is being produced by the firm's aircraft wheel and brake division. He said that excessive temperature with an attendant possibility of overheating and deterioration of brake parts, leakage of hydraulic rubber parts, and tire and rubber deterioration have been overcome in this new brake. Consequently, he reported, high kinetic energy values of pounds of brake weight are possible.

## Navy Procurement Appears Settled

Navy's aircraft procurement program for the post-war transition period appears fairly well settled, pending further action by Congress. Other than a reduction of the Martin PBM schedule from five to two, a research plane has been no significant changes in Navy's procurement program for nearly two months.

All of Oct. 1, deliveries for the last half of 1945 were to be 335 aircraft, for next year 1,048, and for the last half of 1947, 1,048.

**Bigot Policy**—However, deliveries are not missing schedules due to a more rigid acceptance policy. Without the pressure of urgent war

needs, the Navy is making every plane come up to its exacting standards. One result of this tightened inspection and acceptance policy is that last month Navy acceptances were almost 100 under schedule, even though production was considerably in excess of schedule.

## Commercial Orders Increase At Martin

Glenn L. Martin reported that his company has added a considerable amount of commercial business to its \$62,000,000 backlog of military contracts.

He mentioned the PCA orders for Martin's new 300 twin-engine transport and said that others from other airlines are expected. Martin said: "We have reason to believe that this 30 to 40 passenger aircraft whose principal features are extremely low operating cost, high cruising speed and greater maneuverability will become the standard transport type in the years ahead." Martin range report.

**Dividend**—A company dividend of \$1.50 on the common stock of the company was declared at a board of directors' meeting. The dividend is payable Dec. 31, 1945 to stockholders of record Dec. 10, 1945.

## Surplus Fabric Dope Offered By RFC

Surplus pigmented lacquer aircraft fabric dope is being offered for sale by the Reconstruction Finance Corp., Office of Surplus Property, 429 Second Street, S.W., Washington, D. C., and must be accompanied by certified check.

## Jack & Heintz Enter Electric Motor Field

Jack & Heintz has entered the aircraft electric motor field with the introduction of the first of a group of new lightweight continuous-duty geared motors. These power-package units are being made available in sizes ranging upward from one horsepower.

**First Model**—The first model, designed for 26-volt DC systems as rated for continuous duty at 3 hp with a speed of 3,600 rpm at the spoked output shaft. The self-cooled unit, developed to operate efficiently at 40,000 feet altitude, weighs 13½ pounds.

### BRITISH AIRLINER FOR OVER-OCEAN SERVICE

Britain expects to put the Avro Tudor in service on the North Atlantic run next year. Separate sleeping cabin, dining room and cocktail lounge will be some of the four-engine craft's features. Picture shows fuselage construction of the plane.

## Salvage Venture

Some Canadian war veterans, using unusual ingenuity, are salvaging their own remanufactured planes through the facilities of Aircraft Maintenance Salvage Co., Inc., a company manufacturing aircraft equipment such as wheelchairs, auto trailers, paint sprayers, quick-freeze units for hives and miniature gasoline powered carts for chicken houses.

W. G. McLean, president of the company which has headquarters at St. Lambert, Que., near Montreal.

**Technique**—Typical of the products is the wheelchair made of steel aircraft tubing for the frame with the handles and footrests made from the tail wheel of an aircraft as a wheel. The side trailer uses sheet metal from the fuselage wings for the undercarriage, 16 gauge sheet steel for the body, and Tiger Metal wheels from tires.

Fighter trunks supply revolving gas tank enclosures involving gas tank enclosures for the paint sprayer. The stainless steel frames of bombers and parts from the trunks make the quick freezing cart for the home.

Pristine Corp. at \$1.90 per gallon delivered. A large quantity is available, RFC states.

Colors in stock include black, white, red, gray, blue and silver drab. Minimum quantity that can be sold is 25 gallons. Orders should be addressed to Reconstruction Finance Corp., Office of Surplus Property, 429 Second Street, S.W., Washington, D. C., and must be accompanied by certified check.

## SERVICE REPORT THE PARKER APPLIANCE COMPANY

We continue to get good reports on the performance of Parker products on combat aircraft -- especially on the Curtis "Hell Diver", one of the most effective carrier-based planes.

The Hell Diver uses a very extensive hydraulic system -- to operate wing folding, wing hinge plan, landing gear, bombs, bomb doors, flaps, dive brakes and auto pilot. This calls for a large number of Parker valves and fittings.

One of the special features is the Parker dual fueling valve used to switch off fuel when taking plane behind deck for servicing or in emergencies.

This valve must operate quickly and must give complete protection against leakage of highly volatile gas. This was a difficult problem, solved only by experience. Pilots and maintenance men talk as only an older de-fueling valve is as dependable as the one designed and built by Parker.

Just where a possible use for this valve is industry -- for example, aquaplane tank cars, draining chemical or processing tanks, and the like?

The patented Parker Triple Coupling--easy to install and service--prevents against leakage and vibration.

The principle of this coupling is the basis for modern Fluid Power Systems.

FLUID POWER PRODUCTS FOR ALL INDUSTRY

## PERSONNEL

**Neff on Terminal Leave  
After Service in Navy**

Carrie Walter H. (Bob) Neff, who was officer in charge of the aviation section of the Navy's Office of Public Information, and assistant director of Navy public information program planning, is on terminal leave after three years' service.

Formerly public relations manager of the eastern region for United Airlines and later assistant director of public relations with Pan American Airways, Capt. Neff also served for a short time with the Air Transport Association in Washington in connection with airman welfare, public relations and advertising problems.

**Peterson Named To Head  
AIA Technical Service**

Ivar C. Peterson (below) has been appointed director of the Technical Service of the Aircraft Industries Association, Washington, D.C. Ivar C. Peterson, who resigned to accept an engineering executive position with a private company in 1945, has returned to his former company. Peterson, who joined the technical service in 1943 from the National Advisory Committee for Aeronautics, has served the AIA as secretary of the Aircraft Technical and Airworthiness Requirements Committee. He will continue to serve these committees.

**John E. Siedleman** continues as assistant technical service director in charge of activities of the Engine and Propeller Technical Committees, both of which he serves as secretary. Victor G. Stedman, who serves on the Instrumentation, Control and Navigation Committee of the National Aircraft Standards Committee, will assume his duties.

Eastern Air Lines, Inc., has appointed four station managers for its new Great Lakes division. Francis

E. Williams, former station manager at Nashville, will be station manager at Detroit. David W. Bagshaw, station manager at Macon, Ga., will be station manager at Cincinnati. Harold E. Boggs, previously chief manager at Akron, and Edward M. Ritten, formerly chief agent in West Palm Beach, will be station managers at Roanoke.

Capt. Charles S. Vaspas has become director of the Atlantic division of Pan American Airways. Vaspas has been assistant chief pilot for the New York sector, Africa-Orient division of Pan Am.

**Arthur E. Raymond** will head the Institute of the Aerospace Sciences, successor to the Society of Experimental Engineers. Charles H. Colvin, retiring president, Raymond is vice-president-engineering for the Douglas Aircraft Co., having joined the organization in 1925. Previously he was assistant professor of aeronautics at the California Institute of Technology. He studied aeronautical engineering at Massachusetts Institute of Technology.

**William Kline Dennis**, formerly librarian for Beech Aircraft Corp., Lakewood, has been named head librarian for Beech Aircraft Corp., Wichita.

### TEN YEARS' SERVICE:

J. H. Knobellberger, left, president of North American Aviation, Inc., presents a 10-year service pin to R. M. Rice, vice-president and chief engineer. Rice joined the company when it began operations at Dallas, Md., and has been chief engineer since 1939.

### AWARDED FOR RESEARCH AND INVENTIONS:

**Robert Adair** Louis de Flora, assistant chief of the Navy Office of Research and Inventions, was presented the Distinguished Service Medal by Undersecretary of the Navy Artemus L. Getty for his work as director of the special division of the Bureau of Aeronautics which developed training aids for Navy and Army pilots. In 1944 Adair de Flora was awarded the Robert J. Collier trophy by the National Aeronautic Association for the greatest achievement in American aviation.

**Neil T. Dalton**, former acting head of the Office of War Information charged with its liquidation, has been appointed director of the division of arms and public relations consultant to the Foreign Legislative Committee office. He replaces Bert C. Poole, called back in his post and a director and vice-president of the J. Walter Thompson Co., New York. Dalton is the former managing editor of the Louisville, Ky., Courier-Journal.

**Joseph E. Terry**, for the past two years field manager in the general traffic manager of American Airlines Systems, has been appointed district agency and international manager for the New York area.

Air Commodore A. L. James, Montreal, has been named manager of the Canadian government's air council for research and development, succeeding Air Commodore E. W. Siedman, Ottawa, who retains James has been associated with test flying, repair and maintenance and aeronautical engineering for the RCAF since 1936.

**Major John G. Maxwell** has been appointed district traffic manager for Trans-Canada Air Lines at Winnipeg, succeeding R. D. Bunting, recently appointed to the general traffic department.

... "We sell **GENERAL** Airplane tires because they are the finest tires made for an airplane"

### New Airline Survey Presents Handy Guide for Investors

Stock exchange firm's annual review, profusely illustrated and more complete than its predecessor, weighs the pros and cons of the air transport investment situation.

A comprehensive picture of the airlines as presented by Merrill Lynch, Pierce, Fenner & Beane, New York Stock Exchange firm, in another of its annual reviews of the industry. More complete than any of its predecessors, this 35-page survey weighs the pros and cons of the industry and has a comprehensive analysis of each of the airlines. Profusely illustrated with charts and maps, this work affords a handy compendium for the airline investor.

The favorable factors enumerated are:

► Air transport activities, with war contractions removed, are beginning a new phase of the speculative growth trend witnessed for many years past.

► Passenger traffic may rise to several times pre-war peak in first few post-treaty years. Passes are expected to show progressive declines, with a resultant further broadening of demand for air services.

► Additional gains in mail tonnage likely for some carriers as post-air rates decline, earnings eventually may carry all first-class mail except short haul business.

► Most of early subsidy elements in mail pay picture already eliminated reflecting steep rate cuts and tremendous rise in tonnage.

► Vast expansion of freight-express business anticipated in early years, helped by rapidly decreasing charges for this class of service.

► Airlines likely to capture some traffic now moving over surface transport facilities.

► Equipment of improved performance and design to be available in large quantities before long.

► Air transportation should continue to benefit from constructive Government policies in coming period. Cut-throat competition is likely to be held in check.

► Great number of trained flying

and ground personnel available for commercial aviation employment, as result of the war.

► Capitalists in most instances are of moderate size and should not reach burdensome proportions even with heavy financing needs.

► With possibly only minor changes in structure, the basic investment in earnings should be irregularly extended in next few years as prospective gains in volume and new operating economies should offset certain limitations.

The unfavorable elements are listed as follows:

► Growth will involve variety of problems, including insufficiency of greater financial resources than most companies at present possess. In certain instances, expansion of capitalization may serve temporarily to restrict company per share results until the company's operations have caught up with the rise in capital structure.

► Competition within industry becomes more intensive reflecting increasing number of service distinctions and the maturing of the equipment market.

► Surface carriers likely to continue efforts to enter airline field as broad front. Lower rates and service improvements, undisclosed in railroad field elsewhere, will tend to augment competitive forces.

► New international services may require to develop important earning power.

► Temporarily, excess profits taxes may be a retarding influence for few companies, although this factor is expected to wane in significance before much longer.

► Abnormal load factors of war years expected to drop over medium term, tending to exert strong high operating margins.

► Airlines are having more progressively heavier outlays for airports and other ground facilities

necessary in the very near future.

► There is a long range possibility of more stringent regulation of profits. For some time ahead, however, no rigid ceilings indicated in the report.

► Medium term earnings trends may show lack of uniform development while dividends will be generally limited for indefinite time to come.

Clear observers while recognizing the summary nature of the company descriptions, believe that a more complete picture would be presented if the various ratios were more clearly defined. Further, along with the balance sheet data, it would have been most helpful to indicate book values per share. Some question surrounds the wisdom of calling load factors "percent units sold." This can be misleading, as many firms today are burdened by percentages of heavy cargo loads and were it not for this practice, more passengers could have been sold space. In any event, the summaries and statistical record going back to 1935, accompanying each company, should prove very helpful.

► **Statement**—In the general description of the industry, a few eyebrows may be lifted at the comment "...the Department of State which is actively preparing for American flying rights abroad employing a more aggressive policy than ever before." People in the industry work that was so

## MAKE THE SKYWAYS YOUR HIGHWAYS

*Learn to Fly!*

### WRITE FOR THIS FREE BOOKLET

IN THE interest of aviation progress, Firestone recently published an interesting and informative new booklet entitled "Make the SKYWAYS Your Highways — Learn to Fly," a copy of which is yours for the asking. All you have to do is fill out the coupon below and send it to Firestone, Akron, Ohio. It tells just what steps to take in learning to fly. It will prove invaluable to flying schools, airport operators and aircraft dealers in stimulating interest in flying.

For many years, Firestone has been a pioneer in aviation and is now organizing a nationwide network of independent aircraft dealers who will carry hundreds of useful products, including tires, spark plug bases, brake lining, radio transmitters, receivers, and aircraft motors, propellers, cleavers, and aircraft finishes. Please, windshields, flight calculators, aircraft finishes, flying jackets, gloves, sun glasses and many others. There are still some territories open for alert, aggressive distributors and dealers. Write, wire or phone today.

CHARTER

NON-SCHEDULED

INTRASTATE

A S S O C I A T E D      C O M P A N I E S

### Clinic Hears Federal Regulation Of Feeder-Charter Lines Attacked

Gaside forecast non-scheduled service will reach every U. S. community in a few years, citing flaws in policy of government supervision.

Charter and feeder services will reach every community in the U. S. within a few years, but placing the infant non-scheduled transport industry under federal regulation today is unnecessary, the National Aviation Clinic was told by one of the leaders of fixed base operators. Joseph Gammie, president of E. W. Wings Airways, Inc., said:

"Right now charter service is more of a bane of contention than feeder lines," he said, "because it is under the scrutiny of the CAB to see whether it needs what is known as economic regulation. I believe that we in the business are agreed that the operators deserve credit for the manner in which they attempted to reach a solution to the problem."

**Arguments.** — "Their recommendations as a whole, however, are not good either for the industry or the public."

"There has been no price competition as there is no need for economic regulation from that viewpoint."

"The proposed economic regulation includes salting that will act to stimulate the business. It simply puts the bill on an empty pot," the Clinic's only speaker on the non-scheduled transport industry asserted.

"If the federal government is to concern itself with the economics of charter and other non-scheduled aviation, then it must, to be consistent, assume some responsibility for developing a revenue system for some air transport system as it was done for the mail division of the business with notable success."

**Price-making.** — "For several years, charter rates will be higher than other forms of travel, but thousands will insist on using that service because the war has taught them how important a saving in time it can be. It seems funda-

mentally wrong to say that any time-saving advancement is impractical simply because it is costly. Remember that motoring is more costly than riding a horse."

The speaker pointed out that the long-haul airline, even if it is profitable, says, "We can't afford to go to a station. Cost was high as compared with other transportation. The passenger had to weigh his and questionable dependability against the value of his time. On that basis the airline grew and flourished and overcame many of its difficulties," he said.

**Policy.** — To be sure," Gammie added, "the airlines had the advantage of a progressive and farsighted government policy that recognized their needs and helped them to grow. That same policy of development can be applied to short-haul service."

**Equipment.** — Because safety is a paramount factor of operation, the most desirable planes are twin-engine equipment. But there has never been a wide choice of light multi-engine aircraft. While operators want for twin-engine aircraft for all flying, Gaside recommended single engine equipment for day use.

**Rates.** — Operators with little experience must be able to anticipate revenue with enough accuracy to set a sharing rate and then "feel this way along" toward pricing rates and consequently increasing business and to profit.

**Markets.** — Charter operators need to compete directly with trans or scheduled airlines, but should be able to hit that level of the travelling public which prefers to use the private car or bus in preference to the bus or trailer.

R. H. W.

### 4 Canadian Lines Get Charter Permits

Four aircraft operators have been granted licenses by the Canadian Air Transport Board for non-scheduled charter commercial air services, all on a basis of "the present and future public convenience and necessity." None have been given rights for the establishment of scheduled services from the basic license.

Austin Airways Limited, operating since 1933, has been granted a

### Flower Shipment Contract Signed

California Flower Shippers and National Skyways Freight Corp. have signed a contract for shipping of 12 tons of fresh flowers by air each week from California cities to Chicago in the airline's Budd Comets transports. These will be increased in cost to the ultimate purchaser of the flowers, it was announced.

"I am sure that the consumer, the largest commercial air user, is content with the contracts just signed in this country outside of the Post Office Department's air mail contracts."

**Plan.** — California Flower Shippers are wholesalers and shippers in Los Angeles, San Francisco, San Mateo and Dallas. Orders in western and eastern cities are consolidated. It is planned to repackage the flowers with fibreglass, and thermostats will maintain temperatures at 45 degrees.

Shipping is done in padded and

carton weight will cut transportation cost to virtually that of rail rates, it was said. Shippers will be picked up at destination and the consignee will receive blossoms which will remain in good condition for several days even though non-refrigerated products.

**Crash.** — Crash of one of the line's Comets in New Mexico was attributed to a technical fault in service and unable to meet all demands until three additional planes of the same type have completely overhauled in two or three weeks. Another Budd, an ex-hire but unoccupied, is on hand but is unoperational.

Two of the company's pilots, Robert Sawyer and Lawrence Fleisher, were killed and Ronald Lewis, flight engineer, was injured, when the transport crashed 40 miles southwest of Albuquerque, N. M., in a storm.

## For Progress in Radio

Here are views of the just-completed Collins hangar at the Cedar Rapids Airport, and the company's 185 twin-engined Beechcraft. The installation is dedicated to constant advancement in the design and performance of radio communication and navigation equipment for aviation.

Customers of Collins equipment are available for installation and service. The Cedar Rapids Municipal Airport, with its 3400 ft. runways, will accommodate the largest aircraft. Collins Radio Company, Cedar Rapids, Iowa, 11 West 47th Street, New York 18, N. Y. In Canada Collins equipment is sold by Collins Fisher Limited, Montreal.

IN RADIO COMMUNICATIONS, IT'S...

**COLLINS**

because to operate out of Nakina, Ont., with passengers and goods, giving air service to prospectors, trappers, trading post employees, water-power development personnel, tourists and others using the area.

**Globe-Johannsen Flying Service Limited, Winnipeg, has been given two non-scheduled charter service licenses. The company has been operating for 12 years. It will operate one service out of St. Paul Lake in Northern Manitoba, and another out of Winnipeg, covering the Manitoba mining and fur trapping areas. Two scheduled services operate there, Arrow Airways and Wings, both subsidiaries of Canadian Pacific Air Lines, which asked that the non-scheduled service not be permitted to operate between points on its routes.**

**Leavenworth Air Service Limited, Lac Mégantic, Quebec, has been operating a non-scheduled service since 1934 from a base at Dennis d'Entremont, Lac Mégantic, a special and tourist center, was licensed to continue this service and operate in the country north of the Ottawa and St. Lawrence rivers.**

**Fletcher Air Transport, a new company, has been licensed to operate out of Sault Ste. Marie:**

## Hearings Open On Docket 1501

With approximately 30 hours set aside for the testimony of 18 witnesses, CAB's oral argument on Docket 1501, the investigation of non-scheduled air services, begins today, Nov. 26, 1945, at the Commerce Building in Washington, D. C.

CAB Chief Examiner Francis W. Brown, in announcing the final stage of the investigation, emphasized that argument must be confined to the proposed revision of the order exempting non-scheduled carriers from economic regulations.

**Witnesses** — Appearances scheduled are:

Philip Schles, Public Counsel; Wm. L. Anderson, Pennsylvania Aeronautics Corp.; Martin Grasey, Pennsylvania Airlines; Trade Assn.; Joseph Garofalo, National Aviation Trades Assn.; Bruce Turner, National Aviation Trades Assn.; Wayne Weishaar, Aeronautical Testing Society; B. B. Otto, Feeder Airlines Assn. and Otto Aviation Corp.; James W. Esselton, United Pilots and Mechanics Assn. and a number of air service operators; Arthur L. Borrmann, Non-scheduled Flying Ad-

vocacy Committee; Earl W. Sorenson, American War Duds; Caesar Cone, Greenboro-Syracuse Post Airport Auth.; Edward H. Lowry, Jr., and Herman E. Riddell, Trans-Marine Airlines, Inc.; Arthur Stern, Empire State Air Transport Co.; Albert F. Berlin, Harry R. Phillips, Vernon C. Kunkle, and cargo transport Corp.; Gates Lear Globe Freight Airlines, Inc.; J. D. Durand, Air Transport Assn. of America; E. Smythe Gundrell, Eastern Air Lines, Inc.

## Western Conference Set On Aviation Legislation

Representatives of West Coast aviation groups may be expected to reach an accord on their attitude toward future aviation legislation when they held their annual Western Aviation Conference in Sacramento, Calif., Dec. 11-12.

The conference is an expansion of the California Aviation Conference held in Hollywood last winter, and sponsored by the Los Angeles Chamber of Commerce.

**Participants** — The Sacramento conference will have the combined membership of a large number of organizations, including the National Aeronautic Association, the San Francisco Bay Area Aviation Committee, the Bay Area Council, Sacramento Chamber of Commerce, and the Los Angeles Chamber of Commerce.

Bureau and civic leaders have been invited to attend the conference, and scheduled discussions will cover airport problems, commercial and private flying, flight training, and federal and state legislation.

## Southern Feeder Line Planned By Veteran

A South Pacific air veteran—Lt Col. Paul B. Davis of Shreveport, La.—has his plans all made for a feeder airline to serve southern towns.

He returned to the U. S. several months ago with the signatures of 40 trooper carrier and bomber pilots on agreements to fly for him.

**Routes** — His "Scout" system—Southern Commercial Air Transport Inc.—would serve New Orleans, Baton Rouge, Natchez, Jackson, Vicksburg, Grenville, Clarkdale, Helena, Memphis and Memphis on one route. Another would stop at small cities between Memphis and Lake Charles, and a third would serve small cities between Fort Smith, Ark., and Mobile.

**Non-Scheduled Activities** — The CAA chart indicates that before the war non-scheduled carriers derived the greatest part of its revenue from nightflying, followed by charter work, from which has sprung uncertificate air transport. Different statistics on non-scheduled operations are sketchy due to the recent rise of unlettered air transport as a business distinct from the myriad agencies of the former fixed-base operator.

# How would you like to fly in Hiram Maxim's "Air Leviathan" today?

In 1914, Sir Hiram Maxim tested his four motor biplane ("Wing surface," 1,102 sq. ft.—engine, 120 h. p.—Propeller, 17 ft. 3 in.) in London to measure the power of his propellers. Maxim knew the mistake in running gear on the ground. After starting up, he found the engine had stalled. As the ship nose-dived sharply, it crashed through the steering gear rods. Maxim's biplane served as a purpose, but without rear's drive or device further to produce better, Maxim's design would still be carried "proudly" airplane.

...airways. They are also journeys of romance, a means of bringing the world closer together in commerce and understanding.

Dream leadership, however, is not enough. If we are to grow ever stronger in the air, there must be many more to take hold of new ideas and make them work—more to build these ideas into the better planes of peace. Yes, and now to fly them.

And that is good. For continually improved aircraft in the hands of peace-loving nations can help forestall aggression in the world. They are peace

# Tulsa Municipal

ONE OF THE BIGGEST,

BUSIEST AIRPORTS OF  
'EM ALL PICKS  
PHILLIPS

We want you to know about an airport and this is it on its toes, alert, and progressive as they come!

The Tulsa Municipal Airport isn't just a post-war dream...it's a present-day reality.

Previously restricted because of military security, these are the facts of this tremendous operation: It comprises 1,680 acres of land. It has 20 concrete runways, 8.5 miles in total and 150 feet in width.

These runways accommodate the largest bombers and cargo ships landing and with its modern facilities it will be able to handle 2,500 planes daily!

Tulsa's fueling facilities are another feature. New-type pumps in use are capable of pumping 90 gallons of gasoline a minute. Gasoline storage tanks have been increased in capacity to 100,000 gallons.

Now, here's the pitch for Phillips. We think a pretty good indication of an aviation Gasoline is the kind of people and planes that use it. We think the fact that Tulsa Municipal Airport is a Phillips customer speaks louder than all the product claims in the world.

We earned that confidence, I tell ya...we like a chance to earn yours. If you have a problem which involves aviation gasoline, why not let us take a crack at it? Just write to the Aviation Department, Phillips Petroleum Company, Bartlesville, Oklahoma.

(Above) Miss Administration building at the Tulsa Municipal Airport—one of the most magnificently designed buildings to be found at any airport.

(Left) C.W. Shaw, Jr., Manager of the Tulsa Municipal Airport since its inception in 1938, well known throughout the aviation industry.

## TRANSPORT

### Airlines Hurrying to Carry Out ODT Set-Aside of Military Space

Carrriers will set up schedules and interline routings to comply with 70 percent reservations with as little inconvenience to the public as possible; expected to last six months.

By MERLIN NICKEL

The airlines were hurrying last week as plans to carry out an ODT order, effective Dec. 3, to reserve seats available to civilian air travelers on eastbound flights from the West Coast to 28 percent of what they were Nov. 20, and make the other 10 percent available to returning military personnel.

Through the Air Transport Association, the carriers announced they would set up schedules and interline routings to carry out the order with as little inconvenience as possible to the public. Troop traffic will leave West Coast terminals in groups on the four main transcontinental lines going to East Coast separation centers directly when possible, or by connecting carriers if necessary. The interline plan is expected to bring 10 airlines altogether into the program. Details are being worked out. A meeting to consider them was held the day the order was issued.

**Duration.**—Army sources said privately they expect the necessity for the order to continue not more than six months, with December and January the peak. But whatever the prospect, the news came at a time when many of the lines were booked heavily through the holiday season and even beyond.

Cancellations will be unavoidable, but ATA hopes that "civilians will realize that is our first obligation to get the boys home." **Short Notice.**—Issued Nov. 20, the order gave the airlines less than two weeks' notice. It was the first affecting air traffic caused by the ODT. Under it airlines operating east from Seattle, San Francisco, Los Angeles and San Diego must make available daily to the armed services—roughly for division 60-54 between Army and Navy—not less than 70 percent of their seat space on eastbound flights from those points on the

base of Nov. 20 operations. The personnel to be accommodated will be that returning from the Pacific theater to Huston, New York, Philadelphia, Washington, Norfolk, or Jacksonville. The services will pay regular rates for the space.

Estimates as to the number of soldiers, sailors and marines that can be accommodated vary from 650 a day to 900. ODT's figure is 800, which would be about 24,000 a month. ATA forecasts 25,000 a month. In the Army Transportation Corps the hope is it will run about 1,200 a day, or 38,000 a month.

► **Situation.**—Army says service

#### FREIGHT CONTRACT:

In preparation for its new air freight program Dec. 1, American Airlines has a contract for ground service at eight Texas cities signed by Carroll M. Bennett, vice president of Mid-Atlantic Freight Lines, Inc. Charles P. Beard, Brewster vice president (right), here peers out on a route map the cities for which the truck line will provide door-to-door pickup and delivery service. Each day on the Brewster route will have similar service.

On the other hand, CGT pointed out that the railroads with roughly 70 percent of their Pullman cars in Army service, and their coaches subject to call, also will be faced with a critical space shortage.

The situation confronting the airlines was expected to be alleviated when converted four-engine equipment is ready for use, and there were some predictions that the order might speed the availability of surplus planes.

## Long Under Way

Moves to obtain allocation of spare space for demobilization travel has been under way in military quarters for some time.

Soon after mid-October the Army Transportation Corps traffic control division suggested to the airlines an interview in that regard, and a meeting to discuss the subject was held late last month. The service corps, however, said they were not able to set aside in advance the amount of space indicated as necessary.

It appeared at that time that the Army probably would seek establishment of a temporary, limited priority as a solution.

men will be returning from the Pacific to West Coast ports at the rate of about \$10,000 a month, November through April. The situation is the opposite from that of those returning to the East Coast, which is the opposite from that of those returning from the Pacific.

Estimates as to the proportion of soldiers, sailors and marines that can be accommodated vary from 650 a day to 900. ODT's figure is 800, which would be about 24,000 a month. ATA forecasts 25,000 a month. In the Army Transportation Corps the hope is it will run about 1,200 a day, or 38,000 a month.

► **Result.**—While the ODT order has no direct bearing on westbound traffic, some airline people expect it to have one indirectly, especially in the Southwest, who might be more likely to fly to the West Coast if they could be assured of return airline space.

On the other hand, CGT pointed out that the railroads with roughly 70 percent of their Pullman cars in Army service, and their coaches subject to call, also will be faced with a critical space shortage.

The situation confronting the airlines was expected to be alleviated when converted four-engine equipment is ready for use, and there were some predictions that the order might speed the availability of surplus planes.

## In-Flight Refueling Studied in Britain

Procedure discussed as expedient for getting short-range transports across ocean; bombers would be tankers.

In-flight refueling, it is a hard practice in endurance runs of the 1930's and '30's, now is proposed as an expedient for putting Britain's short-range transport equipment across the Atlantic, and as a means of narrowing the gross-weight-payload spread for any or all long-range operations, pending the development of lighter fuels.

The proposal, by Flight Refueling, Ltd., is outlined in a recent issue of The Aeroplane, British magazine, with operational and economic data. Flight Refueling's primary objective is to enable the British to compete with American long-range equipment during the two years or so until they complete their own long-range designs.

(So far as could be learned, there is no recent or present interest in this proposal, either from a military or civil aviation standpoint, in in-flight refueling.)

**Tested**—Flight Refueling's data is based on experiments during the past 12 years under the management of Sir Alan Cobham and an English flying-boats operation during the war. Mr. C. H. Latimer-Needham recently joined the company's staff as chief engineer. He is convinced, says The Aeroplane, that in-flight fueling will answer the immediate problem and lead to reduction of gross weights and take-off loads.

Transfer of fuel from a flying tanker to an aircraft was accomplished many times during Civil Aviation Authority trips in 1930's and during the war, and is now a routine procedure, the article says.

**Example**—The Tudor II, for example, will carry 34 passengers and 8,000 lbs. of cargo 17,000 miles in still air. With re-fuel tankers stationed at Farnborough and Gander, on the northern route, or at the Azores and Bermuda on the winter alternate, this plane could carry its normal load across the Atlantic.

The company which proposes to offer the service on a commercial basis estimates cost of each refueling as about \$400 from each of 15 additional passengers plus revenues from 2000-3000 lbs of extra freight, giving a considerable profit to the airline operator.

**Tankers**—Surplus bombers make

surplus allocations

The twentieth allocation of surplus transport aircraft by the Surplus Property Administration, dated October 1, 1947, distributed 49 C-54's among a dozen U. S. airlines.

Largest single allocation was that of 15 C-54's to American which also was allotted five C-46's. Three C-54's went to Northwest, three C-46's to Pan Am, and two C-54's were allotted to Transoceanic, each to Eastern, Pan American, TWA and United, and one each to Braniff, Chicago & Southern, Continental, Delta, National, and Western.

United and Eastern are to receive one DC-3 type plane each, and five C-54's are to go to Swissair, Scandinavian Air Lines, DDL (Dansk Luftfartselskab, Denmark), Royal Norwegian Air Transport, Deutsche Ed. Expresse das Transoceanic (Argentina), East African, and Svenska Ed. Expresse das Transportes Aereos de Angola.

Total of surplus twin and four-engine Douglas transports allocated to domestic and foreign operators now stands at 286, of which 80 were delivered and 112待ing.

## Pan American Doubling North Atlantic Trips

Pan American Airways informed the Civil Aeronautics Board that effective today, Nov. 26, it is doubling its number of round-trips weekly between New York and London by adding two.

Among other airline service changes of which notice has been received recently by CAB are the following:

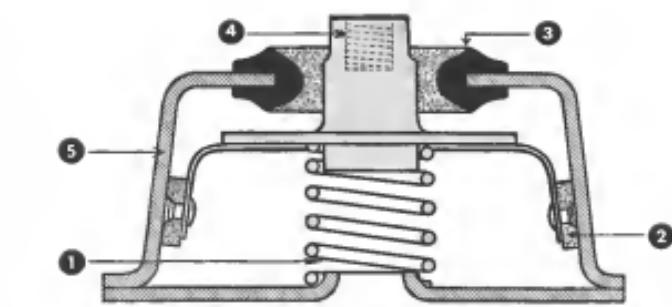

► Caribbean-American Airlines—Flights between coast-to-coast services on AM 20 to Puerto Rico and the Virgin Islands, operating under contract with Pan American, will begin Dec. 15. From Dec. 21, San Juan to St. Thomas and San Juan to St. Croix. Regular service to St. Croix will begin Jan. 1.

► Delta Air Lines—Inaugurates on Dec. 1 the Chicago-Minneapolis service originally planned for the winter.

► National Airlines—Inaugurated service to Norfolk on AM 21 Nov. 10 with flights between Norfolk and Miami and between Miami and New York. Will add one round-trip daily on AM 21 between St. Louis and Miami on Dec. 1, changing route to New Orleans.

► Northeast Airlines—Added one round-trip daily between Boston and New Haven for a total of two and four round-trip daily between Miami and New York. Will add one round-trip daily on Dec. 15 between Boston and New Haven. Will use the Royal Air Station at Brightling instead of Pearl Harbor airport.

► Pan Am—On Dec. 21 will resume service to Key West, Florida, with three trips weekly.

# IT'S NEW

## VIBRASHOCK® UNIT-MOUNT

*Amazingly Effective, Surprisingly Inexpensive*

Robinson engineers offer a low-cost mechanical VibraShock unit mount that closely approaches the high operating efficiency of the famous combination Whetstone Dual Suspension.

Without sacrificing the proven basic vibration principle of three-way vibration dampening, the new unit mount is compact, rugged and long-lived. Comparison tests show substantial improvement in performance over conventional type unit mounts.

The use of stainless steel springs, instead of rubber or plastic, eliminates drift or permanent set-up.

### CHECK THESE OUTSTANDING FEATURES OF THE VIBRA-SHOCK UNIT MOUNT

1. Smooth and quiet operation along three-way freedom on a single unit. (Concentrically balanced to eliminate lateral forces.)
2. Built-in damping mechanism helps dampen continuous and most severe resonance at normal flight speeds. (No external damper required.)
3. Built-in three-way shock absorber completely eliminates roll and yaw as well as side-to-side movement due to resonance.
4. Improved load carrying control, and the ability to withstand high impact loads.
5. Simple, light weight, metal housing having standard dimensions. (Saves on labor.)

This combination of features assures commanding performance in the first complete unit mount offered to industry.

# ATC Expected to Terminate All Contract Work By March 1

Only six of 20 which originally handled operation still are doing so; 12 others hold contracts but have not been called on in some time.

The extent to which Air Transport Command has curtailed the transport operations for which it contracted with the airlines during the war is seen in the fact that only six of the 20 commercial carriers that at one time did ATC work still are operating under Command contracts.

Services of the six have been reduced substantially, with the expectation that all will be terminated by March 1 next year. The companies and the scope of their contract operations: American International and domestic; American Export, international; Northwest, domestic; Pan American, international; TWA, international and domestic; and United, international and domestic.

**Earlier Cuts** — Contracts for transport and modification services with two airlines have been canceled with Colonial in June, 1944, and with Pan American in December, 1944. Cost for the last cancellation for the year was estimated by ATC at \$532,000 for Colonial and \$323,000 for Pan American.

Contracts with a dozen other companies still are in force, although the services required under them have ended and it is not anticipated that any of them again will be called on for ATC service. These carriers, with the date of termination of services and estimated annual cost for the last available full year:

• All American Aviation, July, 1944, \$341,000; United, September, 1944, \$1,142,000; Chicago & Southern, June, 1944, \$365,000.

## WAL Shuttle Starts

Western Air Lines' daily special shuttle between Los Angeles and Palm Springs, Calif., started its mid-moscow after a two-week delay. It had delayed Western's use of its Central Marine Corps air base for a twice daily loop service from Los Angeles to Palm Springs, El Centro and San Diego. Navy denial of the El Centro landing was caused by Marine Corps use of the base for experimental projects.

Continental, October, 1944, \$844,700; Delta, September, 1944, \$322,000; Eastern, October, 1945, \$2,500,000; Mid-Continent, September, 1944, \$450,000; National August, 1944, \$1,728,000; Northeast, April, 1945, \$1,728,000; Pan American, September, 1944, \$281,000; PAA, August, 1944, \$11,800,000; Western, August, 1945, \$522,000. Total for the 13 is \$11,806,400, for one year's operation.

Contract services also have been performed by Southwest Airways and Consolidated-Valley Aircraft Corp. (Cessaway). Contract with the former, which ran \$235,300 for the last year, was canceled in June, 1944. Consolidated still is operating an international transport service under its ATC contract.

## New Aviation Group Urged In Detroit

With inadequacy of Detroit's airport emphasized by American Airlines' failure to use it as a trans-Atlantic terminal, the Detroit Metropolitan Aviation Planning Authority is urging formation of a new aviation planning group to be known as the Regional Aviation Planning Authority.

This group would make plans on a regional basis for all of Michigan, Indiana, Ohio, and parts of surrounding states. An organization would be submitted to the next State Legislature, early in 1946.

**Statements** — Warning factions have strenuously attempted to clear up Detroit's airport mess, with the result that after more than a year of seeking agreement on a site for a new airport, the obsolete Detroit City Airport still remains the one and only major terminal.

Benton and Philadelphia were to be included.

**Reconstruction** — Development of Wayne County Airport (Hamtramck Air Base), which recently reverted to county control, as the major air passenger terminal for the Detroit area was recommended by the Civil Aeronautics Administration. The Wayne County site is on Willow Run Industrial Highway 30 minutes west of Detroit. The recommendation came only a few hours before Americans decided that it was too late to do anything about establishing a European flight terminal point in Detroit.

## San Francisco To Reclaim Tidechains For Runways

First project to receive money from the \$20,000,000 bond issue recently approved by San Francisco voters for airport improvements and expansion will be the reclamation of tidechains on San Francisco Bay, in preparation for runway extension. Special emphasis will be placed on foundations capable of holding a 120,000-lb wheel load.

The bond issue carried by a 3-1 margin. Money spent on the airport to date is said to total about \$17,000,000, and airlines now using the field are reported to be ready to lay out between \$40,000,000 and \$90,000,000 to expand their own facilities.

• The move will place the city in a position to match federal aid funds should they become available.

## Valley Case Cools Off

Heatings in the Mississippi Valley route between Great Northern and Western roads to Kansas City, Mo., last summer, and the national flying. Planes of the organization would be submitted to the next State Legislature, early in 1946.

**Statements** — Warning factions have strenuously attempted to clear up Detroit's airport mess, with the result that after more than a year of seeking agreement on a site for a new airport, the obsolete Detroit City Airport still remains the one and only major terminal.

# "A Piper Cub Is a Good, Safe Plane You, too, Can Afford to Buy and Fly!"

### Get Your "How to Fly" Booklet NOW!

"How to Fly a Poor Cub" describes and pictures the Piper Cub, the most popular 20 step-by-step airplane. Many other facts and educational pictures of Piper Cubs. Get your copy from your Piper Cub Dealer or write Department AN-111, enclosing 50 cents in stamp for postage-inclusive.

### IS YOUR TEAM READY TO FLY?

Ask your team leader, "How's Team X ready for the Cessna Air Race?" And when he answers, "Not quite ready," tell him you're ready. We've got a lot of teams ready! For every team, write Dept. AN-111.

# PIPER CUB

Points the Way to Wings for ALL Americans

## Questionnaires To Be Distributed by PICAO

Air Transport Committee adopts specific forms to be used at all member government Round robin passenger agreement.

Questionnaires seeking a wide range of economic and statistical information on international air transport will be sent by the Pan-American International Civil Aviation Organization, at Geneva, to members of all member air transports.

Specific forms to be sent have been adopted by PICAO's Air Transport Committee. It is hoped that information will be available beginning in January so that a global annual report for 1945 may be prepared.

Activities — Recent PICAO activities also included:

Announcement by De Cozar Grillo, representative of Brazil, that his government had ratified the convention on international civil aviation. Brazil is the first nation to ratify the permanent agreement. PICAO, whose life is limited to a maximum of three years, will automatically be succeeded by a permanent organization when another 20 states have adopted the convention.

Presentation of the official Canadian view on the granting of com-

mercial rights in international air transport at a meeting of the air transport committee.

Convening of the aeronautical maps and charts sub-committee and election of E. H. Peters, Canadian Government specialist, as chairman.

Decision by the Bureau Council to adjourn about the end of November until early in January.

Hearing—An early meeting of the Air Transport Committee will hear the New Zealand viewpoint on commercial aspects of international aviation. It was believed that this nation would be substantially "the same" as that contained in the joint New Zealand and Australian proposals at the Chicago conference.

This plan, rejected at Chicago, was for international ownership and operation of civil air services on world trunk routes.

Canadian Stand—The Canadian statement urged establishment of a permanent convention covering all aspects of world air transport and argued that PICAO's successor should have actual regulatory powers in order to prevent "decades to come from becoming freedom to quarel."

In its recommendations on economic and statistical questions, the Air Transport Committee suggested the calling of an international conference on air mail and spring. For preparation, the sub-committee was asked to gather information from member states on pre-war experience relating particularly to postwar development and its influence on the economics of international air transport.

Other information will be sought on the operation of airports, airline accounting and financial reporting systems, forms and degrees of international ownership of airports and airlines, direct and indirect subsidies, competitive relationships, tariffs and costs of operation. The committee asked that the metric system be used for statistics.

## Orders From Colombia

Wilson S. A., and Lanza Limon, both new air transport companies organized in Colombia, have purchased three Douglas C-47 Skytrains, several planes and ground equipment. Viasa required three Lockheed twin-engine transports and ordered a Consolidated PRY-MA amphibian for operation between Bogota and Cali. Lanza Limon purchased three Wright-powered Avro Ansons planned to be converted for airline operation, and will also establish the first road pick-up service in Colombia.

## Eastern Seeks C-54's

Eastern Air Lines is seeking government allocation of 28 C-54 transports to augment its fleet of 86 DC-3's and 28 Lockheed Constellations to be delivered next summer. The Douglas Superlanders, four of which already have been allocated to EAL, will be converted by the Glenn L. Martin Co. With a cargo capacity of 3,900 lbs., the planes will accommodate 37 passengers and a crew of four or five

## MOVIES FOR TRANS-OCEAN AIR TRAVELERS:

Pan American Airways is helping trans-Atlantic passengers in its C-54's while saving the weight of their movie luggage with sound movies. Equipment has been installed for use in the two-decking of flights between New York and London. Especially constructed equipment is expected to halve the total weight of that seen in the PAA programs, and also simplify feasibility of using the ships so passengers may pack up their choice of radio programs. Television is another future possibility being considered. Photo shows motion picture projector case in use, and a blacked-out cabin with picture in progress.

# Colossus' most important crop

■ U.S. producer though he is, of food and fiber crops, there's one crop in which the American Farmer takes special pride.

His baleful?

In record numbers the upward yield of bales can now form to 700,000—enough, surely, to interest the nation's makers of cloth and lace and baby foods and all the other necessary things. It's a market, too, with needs that change and broaden all the way from infancy through adolescence to mature man- and womanhood.

But it isn't only producers of goods and services who reap the profit from Colossus' most important crop. The babies grow up, filter still into every phase of American life, where their steady upbringing, their close contact with Nature, underscore a contribution to our national life that carries it beyond agricultural. Men and women of business, artists, doctors, dentists, they'll become, one of them, probably a president of these United States.

This is the price of America—this year and in the years ahead—that Country Gentleman helps bring up, educate and develop to full flower. In its pages, those who elect to stay on the family farm are guided in its profitable operations. In its pages, farm mothers learn about the good and useful things a wholesome home should have. In its pages, indeed, is spread the inspiration that urges boys and girls to useful living, whatever their station may be.

Advertisers find, in Country Gentleman, a wide arena of communication with the potent life of rural America and their advertising, year after year, makes them the beneficiaries of the Farmer's colossal wealth and power.

What business can ignore the farmer's strength?

## EDITORIAL

### The Budget Bureau and Aviation—I

TRUE FERVENT ATTITUDE of the Bureau of the Budget toward aviation has been ignored for too long a time, primarily because of a striking lack of information and knowledge about it and a foolish attitude that nothing could be accomplished if we did not do it.

The Bureau is the executive office of the President, has as its prime function, as far as we in aviation are concerned, (1) to assist the President in preparing and administering the budget, (2) to advise the President on changes and recommendations relative to proposed legislation and by making recommendations as to Presidential action on legislation. There are other functions such as to plan improvements, develop, coordinate and assist in the economic operation of federal agencies, and to conduct research into better management.

The power that agency heads wield is tremendous. It items and decisions by authority will be issued to us from federal agencies. The Bureau and the agency will open to it as so complicated that few of them are willing to put up the fight very often.

Further, the agency must rearrange its budget to meet any cut of certain items. No one in the Bureau can make any change whatsoever to an item which has been reduced or eliminated by the agency unless it is specifically authorized by a member of Congress during a appropriations committee hearings. The only limit of the extent of cuts which have been made in an agency's budget is the appearance of the total funds which were available to the agency.

The Budget Bureau also has the power to retard and disapprove any legislation—proposed, or before Congress—by stating simply that the bill is not in accord with the President's program. Many Congressmen, especially on the Senate side, are extremely familiar to party bills which have been so treated.

An expansion of the Bureau's activities will not be surprising. As a matter of fact it had a hand in formulating the CAA. The most important part of the Bureau's control was the manner by established law of the State Department and the Civil Aeronautics Board. The Bureau's mightiest function was to see that State and CAA had the same cross purposes and to set an liaison with the White House.

This is an unusual and unnecessary use of the Bureau and all of its works, because probably in its usual function it would play a much smaller role. The fact that in small number of personnel, about 100, are needed to monitor strict storage or even the most routine activities. Probably no other federal agency is so free from the influence of the Bureau as the Civil Aeronautics Board. Certainly there is no other federal group with as much power while claiming daily work and organization set-up are such a mystery, even to high government officials.

Despite the placement of the Bureau in the executive office, however, it should be realized that the President cannot command personally a direction of the matters he would like to have done. This is the reason that the Bureau would only interfere in the own staff. In practice, administrative analysis, budget executives, fiscal analysis, legislative analysis, statistical and econometric, all performed by high professionals. Ordinarily if they call on the Bureau to act as a consultant, the Bureau, are analysts, economists and statisticians. These men are top flight theorists but frequently with little experience in industry, and, in even the world of federal government, they are far removed from the real world. Aviation is unique in the great transformation going on about them, and tends to postpone perfection. We may never attain a job of planning for tomorrow on the basis of what we know today, but let us keep our eyes. They would stop the world for a year until they could start it off again with a better plan.

The was well illustrated a few days ago when an Army Appropriations Committee and Appropriations Committee during a hearing that the "Bureau which "acted largely on its own initiative," had not yet major research funds for next year because it felt the

Army should peace and take stock of what had been done and what the Army proposed to do. Postponement of research for about a year was actually suggested by the Bureau instead of permitting the department to evaluate and take advantage of the latest scientific advances.

Despite the recent unanimity of our most respected military and industrial leaders on the absolute necessity of continuing the CAA, the House Appropriations Committee requested for research from \$365,000,000 to \$115,000,000. The House Appropriations Committee took the Bureau's figure as given, passed their without change. The Senate Appropriations Committee voted to \$200,000,000. This was then sent to conference.

In the same bill, the first supplemental appropriation section, the Navy requested \$60,000,000 for aeronautical research and development. The Senate rejected this, preventing the Budget to be sent to Congress. Again the House accepted the Bureau's action. The Senate however, resolved the full amount for which Navy had originally asked, after it heard the Assistant Secretary for Air, Sean Sullivan, warn of the seriousness of the reduction.

Many of these facts which the Army and Navy had requested would have been reflected in orders to the aircraft industry.

With regard to the Budget Bureau are indicative of its attitude on all aviation research and development, the Bureau staff another way of doing every effort to weaken the aircraft movement, rather than a policy. However, Congress can protect us in this later in if it does not hesitate to override the Budget Bureau as it does necessary in the public interest.

It is interesting to note that the Bureau's budget was cut down a few days ago of a CAA request for civilian pilot training funds. This followed closely the allocation by the Bureau of a \$10,000,000 grant to the Civil Aeronautics Board for its pilot training program, to keep the post-war fleet supplied with pilots. The result of this cut was described to Senate members of the Appropriations Committee as "extremely dan-

gerous." One of the classic examples of Budget Bureau hindsight was the persistent refusal some years ago to permit funds for the War Training Service to go to Congress. In the event that the war was not immediately necessary, WTS then was preparing plans for our own wartime Army and Navy. Three times the Bureau vetoed the request, and the Bureau received funds from various aviation groups, and Senator McClellan, the agency was permitted to reapply the proper amounts.

The CAA finally sent its national airport plan to the President for submission to Congress it was sent back by the Budget Bureau as ill considered. The plan was rewritten, proposed, and returned, again Budget turned it down. The CAA was forced to take action on its own. In lesson aviation should take to heart by the Budget and relented to the extent of permitting CAA itself to submit its plan to Congress, rather than allowing the President to do it.

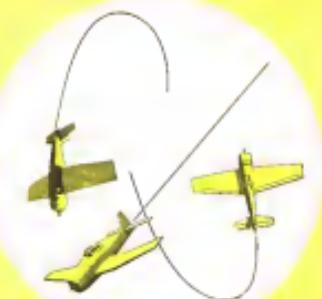

More again the Bureau had thought poorly before. Recently it contended that no airport plan could be drawn up without a nationwide survey—money for which, incidentally, was contained in the CAA. The survey, Budget held, could take into consideration many factors which might become popular CAA already had tried and failed to get either Army or Navy to give any idea of how many airports ultimately would be developed outside surveys.

As in so many other Budget Bureau repetitions, its objections were conveniently arrived at but unproven. There was a right to feel that Bader, Bureau's students should have been aware of the vital need for civil airports, and the importance of hundreds and thousands of them in increasing the utility of the airplane to the public.

Today...Tomorrow - look to the leader for leadership

*Stromberg*

## STROMBERG CARBURETOR RESEARCH

\* \* \* cancelled out gravity and inertia effects  
in aircraft carburetion

Prior to adoption of the Stromberg® injection principle, complete plane maneuverability was impossible without unnecessary or continued "wet" engine power.

The Stromberg injection design eliminated down and the flat fuel level control previously used in carburetors, so that engine performance gives better independent of the attitude of the plane and the effects of inertia.

The tremendous importance of this development on the

newer jet

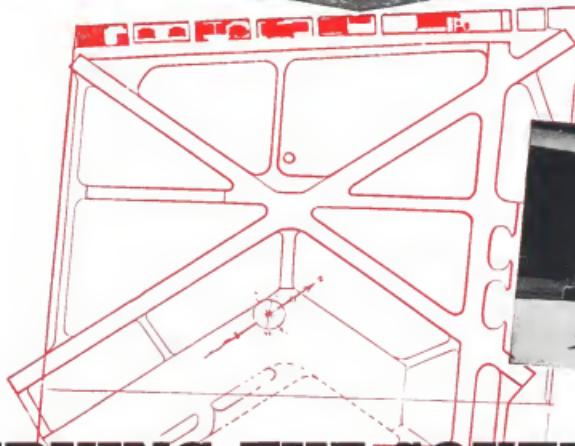

**Bendix** PRODUCTS DIVISION  
Bendix Aviation Corporation, South Bend 25, Ind.

efficiency of our military planes was readily apparent. The importance of Stromberg's constant research in all phases of carburection improvement is now equally obvious, for it is incongruous to state that because of the knowledge and skill of Stromberg engineers—engines perform better—and aircraft gas lasts longer than ever before.

Consult Stromberg on your fuel and control problems. It will pay you to look to the leader for leadership.

SOUTHWEST AIRMOTIVE

C. G. ("Killy") Killingsworth, Southwest Airmotive Line Service Manager, is widely known among fliers for his friendly, efficient service.

## SERVING THE SOUTHWEST

UNDER the able operation of Southwest Airmotive, Love Field Municipal Airport at Dallas has become one of the Southwest's great service centers — and plans for its expansion are already in the making.

Famed for its training of World War I pilots, Love Field has served in World War II as one of America's largest modification centers. In addition, the field is one of the main stops on transcontinental flights. Southwest Airmotive not only services planes for airlines, but has won a nation-wide reputation for its splendid facilities and friendly, efficient servicing of private and commercial planes.

For the past 11 years, Texaco Aviation Gasoline and Texaco Aircraft Engine Oil have been top-ranking favorites with Southwest Airmotive —

just as they are with other progressive airports all over the country, and with leading airlines. In fact —

*More revenue airline miles in the U.S. are flown with Texaco than with any other brand.*

You could have no better recommendation to guide you in your purchases of aviation gasoline and aircraft engine oil.

Wherever you are located, a Texaco aviation representative will gladly help you pick the right lubricants and fuel for your needs, and can often suggest improvements in maintenance practices. Texaco Aviation Products are available through more than 2300 Texaco distributing plants in the 48 States. The Texas Company, Aviation Division, 135 East 42nd Street, New York 17, N. Y.

### RECONVERSION RUSTPROOFING

#### 4 Points to Remember

1. Ordnance Specification P.S. 300-4 contains official instructions for the complete processing of Government-owned production equipment.
2. These instructions require that only rustproofing materials meeting Government specifications be used.
3. Texaco rustproofing products meet Ordnance specifications for application on Government-owned equipment.
4. For full information, see your Texaco representative or write to us.
